

Polygon Similarity

Big Picture

Have you ever seen siblings who look so alike that one seems to be a miniature copy of the other? Similar polygons follow the same concept of being the same shape but different in size. We can prove similarity in polygons, and there are several ways to prove that triangles are similar. Similar polygons also have many properties and relationships that can be used to solve problems.

Key Terms

Similar Polygons: Two polygons with the same shape but not the same size.

Scale Factor: The ratio relating corresponding side lengths of two similar polygons.

Similar Polygons

Two polygons are similar if and only if:

- They have the same number of sides.
- Corresponding angles are congruent.
- Corresponding lengths are proportional.
 - a. For similar triangles, corresponding lengths include side lengths, altitudes, medians, and midsegments.

The symbol $\sim$ means similar. Figure A $\sim$ Figure B is a similarity statement. In similarity statements, corresponding vertices are listed in the same order.

Don't confuse $\sim$, $=$, and $\cong$.

In two similar polygons, the ratio relating any two corresponding lengths is equal to the scale factor.

- Scale factor = Length of polygon 1 : Corresponding length of polygon 2
- Two congruent figures are similar. Their scale factor is 1:1.

If you have difficulty matching up corresponding lengths, redraw the diagrams so that the corresponding lengths are easier to identify.

By definition, all the angles and sides of regular polygons (e.g. equilateral triangles, squares, etc.) are congruent. As a result, all regular polygons with the same number of sides are similar.
