

Variable	Method	How will it effect the rate of fall?
Surface area	This variable can be changed by making circles with different radius	The rate of decent should become faster as the surface area becomes smaller due to less air resistance
Mass	The mass of the parachute can be increased by adding extra weight	The larger the mass of the parachute the faster it should fall to the ground
Material	This can be changed by making parachutes with different materials	The type of material should effect the rate of decent and make it fall faster or slower
Height	The height from which the parachute is dropped	The higher the parachute is dropped from the ground the longer it should take to reach the ground. The lower it is dropped the faster it should reach the ground
Condition of environment	This can be changed by dropping the parachute in different conditions. i.e. windy	This should effect the descent of the parachute because there might be more or less wind or no wind at all

Canning, 1988 The results of surveys of the near and far wake of the Galileo Probe are presented for Mach numbers from 0.25 to 0.95 The trends in the data resulting from changes in Mach number radial and axial distance angle of attack and a small change in model shape are shown in crossplots based on the data A rationale for selecting an operating volume suitable for parachute inflation based on low Mach number flight results is outlined *Evaluation of a Parachute Load Distribution Measuring System During Low Altitude Drop Tests* I. S. Hoffman, 1969 In conjunction with the low altitude preflight drop test phase of the NASA Supersonic High Altitude Parachute Experiments SHAPE program canopy load distributed measurements were made on each of three types of parachute during deployment by means of a mortar from an aircraft dropped payload Loads were measured with miniature load cells at various locations on the canopies and in the suspension lines of 30 and 40 foot diameter 9.14 and 12.19 meters parachutes with a total of seven measurements of this type being made on each of seven instrumented parachute drops Out of a total of 49 such individual measurement attempts there were six individual load cell problems which included one of lead wire breakage during parachute deployment Total parachute load measurements were also made during each test by means of a tensionmeter in the main riser line In addition for the total parachute instrumentation program data from approximately 40 percent of the channels were not obtained due apparently to onboard telemetry malfunction **Test of the Quick Release, Parachute Equipment Bag** Parachute School (U.S.), 1945 *Recreational Pilot*, 1997 **Sport Pilot Practical Test Standards for Weight Shift Control Powered Parachute Flight Instructor FAA-S-8081-31** Federal Aviation Administration (FAA) Staff, 2013-08-15 *Wind Tunnel Test of a Freefall Vehicle for Parachute Testing* David Brian Landrum, Oran W. Air Force Materiel Command. Engineering Division,1948 *Development of Methods for Assessment of Gliding Parachute Applications* ,1982 In order to assess the possible utility of gliding parachutes it was necessary to develop a set of methods for predicting behavior of gliding parachutes The extent of agreement between simulation and flight data indicates that the primary factors included in the longitudinal stability analysis and in the 6DOF simulation are correct Although the stability analysis predicts only steady state behavior it forms the basis required for analysis of dynamic behavior in the body fixed XZ plane The agreement seen in descent rate would not be possible with an invalid stability model Of course in turning flight during the response immediately following the deflection other factors such as the assumed spanwise distribution of lift and drag become predominant The agreement in yaw rate best illustrates correctness of this aspect of the 6DOF model The mechanics driving motion during a spin are quite difficult to understand however the agreement shown in the descent rate indicates that the mass ratios assumed are accurate and further justifies the assumption of spanwise distribution of lift and drag In further development activities on gliding parachute systems the 6DOF model will serve to guide exploratory work and will be updated for more accurate application to different canopies and to larger systems
