

WORKSHEET - LABELING WAVES

- The highest point on a wave is the crest, while the lowest point is the trough.
- The Amplitude of a wave is a measure of the amount of energy it carries.
- The distance from one crest to the next crest is the wavelength.
- The frequency is a measure of the number of waves that pass a point in a given amount of time.
- The illustration to the right shows a wave. Label each part in the space below:

- crest
- trough
- Amplitude
- wavelength

- Use the five illustrations of waves drawn below to answer the following questions:

- Waves P and Q have the same frequency or wavelength, but wave P has twice the amplitude of wave Q.
- Waves Q and R have the same amplitude, but wave R has twice the wavelength of wave Q.
- Wave T shows a steady frequency but changing amplitude.
- Wave S shows steady amplitude but a changing frequency.
- Waves Q and R have a low amplitude and a steady frequency.

- The following questions refer to the diagram to the right:

- Is this wave transverse or longitudinal? longitudinal
- Letter H represents a compression and letter I represents a rarefaction.

Computational Methods for Electron—Molecule Collisions Franco A. Gianturco, W.M. Huo, 2013-06-29 The collision of electrons with molecules and molecular ions is a fundamental process in atomic and molecular physics and in chemistry At high incident electron energies electron molecule collisions are used to deduce molecular geometries oscillator strengths for optically allowed transitions and in the case of electron impact ionization to probe the momentum distribution of the molecule itself When the incident electron energy is comparable to or below those of the molecular valence electrons the physics involved is particularly rich Correlation and exchange effects necessary to describe such collision processes bear a close resemblance to similar effects in the theory of electronic structure in molecules Compound state formations in the form

of resonances and virtual states manifest themselves in experimental observables which provide details of the electron molecule interactions. Rotational excitations by low energy electron collisions exemplify energy transfer between the electronic and nuclear motion. The role of nonadiabatic interaction is raised here. When the final vibrational state is in the continuum molecular dissociation occurs. Dissociative recombination and dissociative attachment are examples of such fragmentation processes. In addition to its fundamental nature the study of electron molecule collisions is also motivated by its relation to other fields of study and by its technological applications. The study of planetary atmospheres and the interstellar medium necessarily involve collision processes of electrons with molecules and molecular ions. **Weather**
