physical elements that make up a clustered PC computing system the software required most of which is freely available and insights on how to organize the code to exploit parallelism Supercomputing research the goal of which is to make computers that are ever faster and more powerful has been at the cutting edge of computer technology since the early 1960s Until recently research cost in the millions of dollars and many of the companies that originally made supercomputers are now out of business The early supercomputers used distributed computing and parallel processing to link processors together in a single machine often called a mainframe Exploiting the same technology researchers are now using off the shelf PCs to produce computers with supercomputer performance It is now possible to make a supercomputer for less than 40 000 Given this new affordability a number of universities and research laboratories are experimenting with installing such Beowulf type systems in their facilities This how to guide provides step by step instructions for building a Beowulf type computer including the physical elements that make up a clustered PC computing system the software required most of which is freely available and insights on how to organize the code to exploit parallelism The book also includes a list of potential pitfalls

Ada-Europe 2001 Dirk Craeynest, Alfred Strohmeier, 2003-06-29 The Sixth International Conference on Reliable Software Technologies Ada Europe 2001 took place in Leuven Belgium May 14-18 2001 It was sponsored by Ada Europe the European federation of national Ada societies in cooperation with ACM SIGAda and it was organized by members of the K U Leuven and Ada Belgium This was the 21st consecutive year of Ada Europe conferences and the sixth year of the conference focusing on the area of reliable software technologies The use of software components in embedded systems is almost ubiquitous planes fly by wire train signalling systems are now computer based mobile phones are digital devices and biological chemical

and manufacturing plants are controlled by software to name only a few examples Also other non embedded mission critical systems depend more and more upon software For these products and processes reliability is a key success factor and often a safety critical hard requirement It is well known and has often been experienced that quality cannot be added to software as a mere afterthought This also holds for reliability Moreover the reliability of a system is not due to and cannot be built upon a single technology A wide range of approaches is needed the most difficult issue being their purposeful integration Goals of reliability must be precisely defined and included in the requirements the development process must be controlled to achieve these goals and sound development methods must be used to fulfill these non functional requirements
