Geometry Form G 4 6:

The Geometry of Spacetime James J. Callahan, 2013-03-09 In 1905 Albert Einstein offered a revolutionary theory special relativity to explain some of the most troubling problems in current physics concerning electromagnetism and motion Soon afterwards Hermann Minkowski recast special relativity essentially as a new geometric structure for spacetime These ideas are the subject of the first part of the book The second part develops the main implications of Einstein's general relativity as a theory of gravity rooted in the differential geometry of surfaces The author explores the way an individual observer views the world and how a pair of observers collaborates to gain objective knowledge of the world He has tried to encompass both the general and special theory by using the geometry of spacetime as the unifying theme of the book To read it one needs only a first course in linear algebra and multivariable calculus and familiarity with the physical applications of calculus

Nearly Pseudo-Kähler Manifolds and Related Special Holonomies Lars Schäfer, 2017-09-14 Developing and providing an overview of recent results on nearly Kähler geometry on pseudo Riemannian manifolds this monograph emphasizes the differences with the classical Riemannian geometry setting The focal objects of the text are related to special holonomy and Killing spinors and have applications in high energy physics such as supergravity and string theory Before starting into the field a self contained introduction to the subject is given aimed at students with a solid background in differential geometry The book will therefore be accessible to masters and Ph D students who are beginning work on nearly Kähler geometry in pseudo Riemannian signature and also to non experts interested in gaining an overview of the subject Moreover a number of results and techniques are provided which will be helpful for differential geometers as well as for high energy physicists interested in the mathematical background of the geometric objects they need

Investigations in Algebraic Theory of Combinatorial Objects I.A. Faradzev, A.A. Ivanov, M. Klin, A.J. Woldar, 1993-11-30 X K chendorffer L A Kalu lnin and their students in the 50s and 60s Nowadays the most deeply developed is the theory of binary invariant relations and their combinatorial approximations

These combinatorial approximations arose repeatedly during this century under various names Hecke algebras centralizer rings association schemes coherent configurations cellular rings etc see the first paper of the collection for details and in various branches of mathematics both pure and applied One of these approximations the theory of cellular rings cellular algebras was developed at the end of the 60s by B Yu Weisfeiler and A A Leman in the course of the first serious attempt to study the complexity of the graph isomorphism problem one of the central problems in the modern theory of combinatorial algorithms At roughly the same time G M Adelson Velski V L Arlazarov I A Faradjev and their colleagues had developed a rather efficient tool for the constructive enumeration of combinatorial objects based on the branch and bound method By means of this tool a number of sports like results were obtained Some of these results are still unsurpassed
