Chapter 1

Problem 1.1

A nucleus, originally at rest, decays radioactively by emitting an electron of momentum $1.73 \text{ MeV}/c$, and at right angles to the direction of the electron a neutrino with momentum $1.00 \text{ MeV}/c$. (The MeV (million electron volt) is a unit of energy, used in modern physics, equal to $1.60 \times 10^{-6} \text{ erg}$. Correspondingly, MeV/c is a unit of linear momentum equal to $5.34 \times 10^{-17} \text{ gm cm/sec}$.) In what direction does the nucleus recoil? What is its momentum in MeV/c ? If the mass of the residual nucleus is $3.90 \times 10^{-22} \text{ gm}$, what is its kinetic energy, in electron volts?

Place the nucleus at the origin, and suppose the electron is emitted in the positive y direction, and the neutrino in the positive x direction. Then the resultant of the electron and neutrino momenta has magnitude

$$|\mathbf{p}_{\text{e}+\nu}| = \sqrt{(1.73)^2 + 1^2} = 2 \text{ MeV}/c,$$

and its direction makes an angle

$$\theta = \tan^{-1} \frac{1.73}{1} = 60^\circ$$

with the x axis. The nucleus must acquire a momentum of equal magnitude and directed in the opposite direction. The kinetic energy of the nucleus is

$$T = \frac{p^2}{2m} = \frac{4 \text{ MeV}^2 c^{-2}}{2 \cdot 3.9 \cdot 10^{-22} \text{ gm}} \cdot \frac{1.78 \cdot 10^{-27} \text{ gm}}{1 \text{ MeV} c^{-2}} = 9.1 \text{ ev}$$

This is much smaller than the nucleus rest energy of several hundred GeV , so the non relativistic approximation is justified.

A New Kirchhoff-Love Beam Element and its Application to Polymer Mechanics Matthias C. Schulz,2022-09-21 The novel finite element formulations fall into the category of geometrically exact Kirchhoff Love beams A prominent characteristic of this category is that the absence of shear deformation is strongly enforced by removing two degrees of freedom Further the corresponding beam theories exhibit not only translational but also rotational degrees of freedom and their configurations thus form a non additive and non commutative space Sophisticated interpolation schemes are required that need to be tested not only for locking spatial convergence behavior and energy conservation but also for observer invariance and path independence For the three novel beam element formulations all these properties are analytically and numerically studied and confirmed if applicable Two different rotation parameterization strategies are employed based on the well known geodesic interpolation used in many Simo Reissner beams and the lesser known split into the so called textit smallest rotation and a torsional part Application of the former parameterization results in a mixed finite element formulation intrinsically free of locking phenomena Additionally the first geometrically exact Kirchhoff Love beam element is presented which strongly enforces inextensibility by removing another degree of freedom Furthermore the numerical efficiency of the

new beam formulations is compared to other beam elements that allow for or suppress shear deformation. When modeling very slender beams the new elements offer distinct numerical advantages. Standard molecular dynamics simulations which are commonly used to study polymers suffer from a lack of a careful mathematical basis and the use of an expensive explicit time integration scheme. To circumvent these shortcomings and to be able to simulate stretching experiments on relevant time scales the problem is described by a stochastic partial differential equation which can be solved using the finite element method with a backward Euler temporal discretization. In detail the polymer is represented by a Kirchhoff Love beam with a linear elastic constitutive model. Inertial and electrostatic forces are neglected. It is deformed by a distributed load mimicking collisions with molecules of the surrounding fluid. Naturally this load heavily fluctuates over time and space and mean values need to be computed in a Monte Carlo manner. To vastly speed up the fitting process to experimental data in a Bayesian framework a surrogate model based on a Gaussian process is set up which directly computes the mean values for given material parameters. The uncertainties and correlations of the material parameters are studied and compared to the literature.

Books in Print, 1994 **Robust Control of Linear Systems and Nonlinear Control** M. A. Kaashoek, J. H. van Schuppen, A. C. M. Ran, 2013-03-07 This volume is the second of the three volume publication containing the proceedings of the 1989 International Symposium on the Mathematical Theory of Networks and Systems MTNS 89 which was held in Amsterdam The Netherlands June 19-23 1989. The International Symposia MTNS focus attention on problems from system and control theory circuit theory and signal processing which in general require application of sophisticated mathematical tools such as from function and operator theory linear algebra and matrix theory differential and algebraic geometry. The interaction between advanced mathematical methods and practical engineering problems of circuits systems and control which is typical for MTNS turns out to be most effective and is as these proceedings show a continuing source of exciting advances. The second volume contains invited papers and a large selection of other symposium presentations in the vast area of robust and nonlinear control. Modern developments in robust control and H_∞ theory for finite as well as for infinite dimensional systems are presented. A large part of the volume is devoted to nonlinear control. Special attention is paid to problems in robotics. Also the general theory of nonlinear and infinite dimensional systems is discussed. A couple of papers deal with problems of stochastic control and filtering.

vi Preface The titles of the two other volumes are Realization and Modelling in System Theory volume 1 and Signal Processing Scattering and Operator Theory and Numerical Methods volume 3.
