

Getting to know your appliance

HOW IT WORKS

Your appliance works by using a refrigeration system to remove heat from food and drink placed inside, thereby cooling them.

The heat is transferred to the surrounding area by a compressor circulating refrigerant (liquid). The heat generated in this process is expelled into the air.

(You can sometimes hear the refrigerant circulating.)

On a conventional appliance frost forms on the cooling surfaces inside, and will form more quickly if the door is opened frequently or if foods are left uncovered.

This frost has to be removed periodically in order to maintain the efficient operation of the appliance ('Defrosting').

On a FROST-FREE model the cooling surfaces inside are hidden from view, and the cold air circulated by a fan. (See diagram.) This gives an even temperature and rapid cooling.

The heat generated in the refrigeration process is expelled through a grille at the base-front of the appliance. (See diagram.)

NOTE: You should be careful not to obstruct this grille.

You may notice that the front edge of the cabinet is sometimes warm, this is normal and is part of the refrigerant circulating system designed to help prevent condensation on the door seal.

BENEFITS OF 'FROST-FREE'

- No defrosting ever
- No ice = More space for food
- Improved temperature control
- Better food preservation
- Frozen food packs do not adhere together
- Quicker temperature recovery after door opening
- Even temperature
