Space, Number, and Geometry from Helmholtz to Cassirer Francesca Biagioli, 2016-08-22 This book offers a reconstruction of the debate on non Euclidean geometry in neo Kantianism between the second half of the nineteenth century and the first decades of the twentieth century Kant famously characterized space and time as a priori forms of intuitions which lie at the foundation of mathematical knowledge The success of his philosophical account of space was due not least to the fact that Euclidean geometry was widely considered to be a model of certainty at his time However such later scientific developments as non Euclidean geometries and Einstein s general theory of relativity called into question the certainty of Euclidean geometry and posed the problem of reconsidering space as an open question for empirical research The transformation of the concept of space from a source of knowledge to an object of research can be traced back to a tradition which includes such mathematicians as Carl Friedrich Gauss Bernhard Riemann Richard Dedekind Felix Klein and Henri Poincaré and which finds one of its clearest expressions in Hermann von Helmholtz s epistemological works Although Helmholtz formulated compelling objections to Kant the author reconsiders different strategies for a philosophical account of the same transformation from a neo Kantian perspective and especially Hermann Cohen s account of the apriority of mathematics in terms of applicability and Ernst Cassirer s reformulation of the a priori of space in terms of a system of hypotheses This book is ideal for students scholars and researchers who wish to broaden their knowledge of non Euclidean geometry or neo Kantianism *Proceedings of Crack Paths (CP 2009), Vicenza, Italy 2009* , **Infrared Spectroscopy**

damages Antonio Monari, Elise Dumont, Chrysostomos Chatgililoglu, 2015-10-02 DNA stores and passes the genetic information of almost all living organisms. Its molecular structure and their intramolecular interactions are particularly suitable to maximize stability against oxidative stress and UV light absorption. Yet the protection and repair strategies are still error prone. DNA lesions are produced including the most complex and highly mutagenic ones. An important threat to DNA stability comes from photosensitization, i.e. from the dramatic multiplication of radiation induced defects mediated by the presence of organic or organometallic dyes compared to the direct exposure to UVA radiation. Moreover the photo induced production of singlet oxygen generates an extremely high oxidative stress on DNA that in vivo normally results in extended cellular apoptosis. Elucidating the processes leading to DNA damages from the production of a simple radical entity to deleterious lesions as well as the opportunities of repair by devoted enzymes is a cornerstone towards the development of more efficient protection strategies. Sensitization and selective production of DNA lesions can also be exploited to induce the selective apoptosis of cancer cells upon exposition to radiation or to oxidative stress for instance in the field of photodynamic therapy. The importance and relevance of the field is witnessed by the impressive amount of high level papers dealing with this complex subject and notably tackling the structural elucidation of DNA and DNA drug adducts, the mechanisms of formation of DNA lesions including the precise detection of the final lesion products as well as the influence of the lesions on the DNA stability and dynamics and the consequences on the ease of repair. Due to the complexity of the field lying at the frontiers between chemistry, physics and biology, multidisciplinary strategies allying modeling and experience are needed. This topic aims at giving an extended overview of the current research in the domain with fundamental contribution from the leading groups in the field of DNA reactivity, structural characterization, photo chemistry and photo physics as well as repair mechanism. It will therefore be a fundamental guide for scientists wanting to address the field of DNA lesion and repair but also more generally for researchers working in rational drug design or in the development of biomarkers and medical imaging techniques.
