- 1. Physics Notes
  - Chapter 2
    - 2.2: Speed is a measure of how fast something is moving. It is the rate which distance is covered.
      - The word rate is a clue that something is being divided by time. Speed is always
        measured in terms of a unit of distance divided by a unit of time.
      - Instantaneous Speed: A speed at any instant.
      - Average speed = (Total distance covered)
    - 0 2.3
- Velocity:
  - The difference between speed and velocity is velocity has a direction.
- Constant Velocity
  - From the definition of velocity, it follows that to have a constant velocity requires both constant speed and constant direction. Constant speed means that the motion remains at the same speed.
  - Motion at constant velocity is motion in a straight line at constant speed.
- Changing velocity
  - If either the speed or the direction is changing, then the velocity is changing. Constant speed and constant velocity are not the same.
  - In a car there are three controls that are used to change the velocity.
     Gas, break, steering.
- 2.4 Acceleration:
  - Acceleration = (change of velocity) (Time interval)
  - The rate at which the velocity is changing is called acceleration. Because acceleration is a rate, it is a measure of how the velocity is changing with respect to time.
  - What defines acceleration is change.
  - Acceleration applies to decreases as well as increases in speed.
  - This is often called deceleration, or negative acceleration.
  - Acceleration, like velocity is directional. If we change either speed or direction, or both. We change velocity. And we accelerate.
  - When straight-line motion is considered, it is common to use speed and velocity interchangeably.
  - Acceleration (along a straight line) = change in speed time interval
  - Speed and velocity are measured in units of distance per time.
- o 2.5 Free Fall, How Fast:
  - Starts from a rest position and gains speed as it falls
