Hill Griffiths Lim Solutions:

Global Responsible Intergenerational Leadership Julia M. Puaschunder, 2018-01-01 Today's grand policy dilemmas from climate change to over indebtedness to demographic shifts have momentous long term implications Future generations will be constrained by our present decisions to an extent that is without precedent in advanced capitalist democracies This book is an extensively researched and reasoned appeal in favor of intergenerational fairness the ability to provide to future generations an at least as favorable standard of living as that enjoyed today Intergenerational equity is an essential consideration in finding lasting solutions to the multifaceted crises of our time As an implicit contract and transfer between living and future generations intergenerational equity avoids discriminating against future generations The book aims to theoretically define intergenerational equity and to frame it as a natural behavioral law capturing human ethicality bounds It follows a long and distinguished tradition of scholarly discourse in turning to natural law for solutions to major social predicaments Outlining some of the causes of the current intergenerational imbalances regarding climate change and over indebtedness it sets the basis for understanding their drivers and implications A central proposition is that the natural human drive towards intergenerational fairness can be the basis for the necessary behavioral responses the human imbued moral compass of natural law can be a useful complement if not alternative to public policy This book fills an important gap Despite a resurgence of literature the economic and social dimensions of intergenerational equity remain underexplored Existing literature misses a holistic ethical framework of decision making failures that addresses intergenerational concerns Whilst evolutionary grounded intergenerational fairness has not been recognized as a natural behavioral law a human imbued drive being bound by human fallibility Practical implications and recommendations in advancing an agenda for the advancement of intergenerational equity are provided Attention is drawn to the problem of providing the required leadership to promote the idea of intergenerational equity as a guiding principle in corporate social and policy action This book contributes both theoretical and practical insights and will be of interest to economists sociologists public policy makers and corporate executives tasked with tackling the most pressing contemporary challenges of mankind **A Textbook on Modern**

Bioinspired solutions to the challenges of chemical sensing Ramon Huerta, Thomas Nowotny, Chemical sensing is likely the most primordial sensory modality that emerged in the evolution of life Without chemical sensing life on earth would probably not exist It is used for detecting nutrients avoiding threats finding mating partners and various forms of communication and social interaction between animals The advent of artificial sensors has created a myriad of problems in the areas of chemical detection and identification with applications in food quality and pollution control chemical threat detection health monitoring robot control and even odor and taste synthesis Efficient algorithms are needed to address the many challenges of chemical sensing in these areas including but not limited to sensitivity levels sensor drift concentration invariance of analyte identity and complex mixtures Defining and improving analysis methods for artificial chemical sensing remains an active research area in engineering and machine learning alike In the course of evolution animals bacteria and plants have developed sophisticated methods and algorithms for solving difficult problems in chemical sensing very efficiently Complex signalling pathways inside single cells can trigger movement toward the source of a nutrient Complex networks of neurons appear to be able to compute odor types and the distance to a source in turbulent flows These networks of neurons use a combination of temporal coding layered structures simple Hebbian learning rules reinforcement learning and inhibition to quickly learn about chemical stimuli that are critical for their survival Olfaction is a vibrant field of research because recent technological advances allow monitoring and manipulating brain areas inaccessible in the past thus allowing for rapid progress This is particularly relevant because to this date the best solutions to many general chemical sensing problems are still found in animals rather than artificial devices Many lessons may yet have to be learned from biological systems to solve the complex problems of chemical sensing with similar success as animals routinely do This special issue has the ambitious goal of bringing together biologists and engineers to report on biological solutions and engineering approaches to chemical sensing challenges in order to better understand in what aspects both fields can find common ground of discussion and to thus promote novel areas of
