Iron and Human Disease R.B. Lauffer, 2018-01-18 Iron and Human Disease is the first book to cover the three key aspects of human iron metabolism the accumulation of iron in adults iron as a limiting factor for tumor and infectious cell growth and iron as a catalyst for oxygen free radical production The book describes the hypotheses and findings related to the role of iron in cardiovascular disease including reperfusion injury cancer aging and autoimmune and neurodegenerative diseases Other topics covered include the molecular biology and biochemistry of iron the general principles governing iron balance iron in the immune system and acute phase response and new preventive and therapeutic strategies Iron and Human Disease will be a useful reference for biomedical investigators physicians nutritionists and public health officials **Human Disease**

**and Iron** Rosalia Kripke, 2025-08-25 Iron is a vital micronutrient required by the human body It facilitates a wide variety of physiological processes such as DNA synthesis electron transport and oxygen transport The human body requires a right amount of iron Deficiency of iron leads to anemia i e low number of Red Blood Cells RBCs in the blood In this condition the blood does not transport adequate amount of oxygen in the entire body Iron is a part of hemoglobin protein that is essential for transporting oxygen from lungs to all parts of the body Some conditions such as pregnancy ulcers heavy periods inherited disorders and a diet lacking iron may also lead to the development of anemia Hemochromatosis is a condition wherein a body absorbs too much iron from the food which is stored in organs like liver heart and pancreas This may lead to liver disease heart problems and diabetes This book outlines the role of iron in human diseases in detail It will prove to be immensely beneficial to medical professionals and students involved in this area at various levels **An Introduction to Human**

**Disease** Leonard V. Crowley, 2004 Intended for nursing students this textbook characterizes the structural and functional changes caused by disease in tissues and organs as a basis for understanding the clinical manifestations and principles of treatment Cowley laboratory medicine University of Minnesota describes the organization **Iron as Therapeutic Targets in Human Diseases** Paolo Arosio, Maura Poli, Raffaella Gozzelino, 2020-02-11 Iron is an essential element for almost all organisms a cofactor playing a crucial role in a number of vital functions including oxygen transport DNA synthesis and respiration However its ability to exchange electrons renders excess iron potentially toxic since it is capable of catalyzing the formation of highly poisonous free radicals As a consequence iron homeostasis is tightly controlled by sophisticated mechanisms that have been partially elucidated Because of its biological importance numerous disorders have been recently linked to the deregulation of iron homeostasis which include not only the typical disorders of iron overload and deficiency but also cancer and neurodegenerative diseases This leads iron metabolism to become an interesting therapeutic target for novel pharmacological treatments against these diseases Several therapies are currently under development for hematological disorders while others are being considered for different pathologies The therapeutic targeting under study includes the hepcidin ferroportin axis for the regulation of systemic iron homeostasis complex cytosolic machineries for the regulation of

the intracellular iron status and its association with oxidative damage and reagents exploiting proteins of iron metabolism such as ferritin and transferrin receptor A promising potential target is a recently described form of programmed cell death named ferroptosis in which the role of iron is essential but not completely clarified This Special Issue has the aim to summarize the state of the art and the latest findings published in the iron field as well as to elucidate future directions
