Zhang, 2014-01-13 Connects fiber chemistry and structure to properties that can be designed and engineered Micro and
nanoscale synthetic and natural polymer and non polymer fibers explained with applications to industrial electronic
biomedical and energy Information pertinent for fiber textile composite polymer and materials specialists This volume
provides the basic chemical and mathematical theory needed to understand and modify the connections among the structure
formation and properties of many different types of manmade and natural fibers At a fundamental level it explains how
polymeric and non polymeric fibers are organized how such fibers are formed both synthetically and biologically and how
primary and secondary properties from basic flow to thermal and electrical qualities are derived from molecular and
submolecular organization thus establishing the quantitative and predictive relationships needed for fiber engineering The
book goes on to show how fiber chemistry and modes of processing for dozens of materials such as silks ceramics glass and
carbon can be used to control functional optical conductive thermal and other properties Its discussion ranges over
microscale and nanoscale fibers nanofibers covering methods such as spinning and electrospinning as well as biological fiber
generation through self assembly Technologies in this text apply to the analysis and design of fibers for industrial electronic
optical medical and energy storage applications *VP J.J. Pizzuto's Fabric Science 10th Edition/Swatch Reference Gu*
