Radu,Jürgen Fuhrmann,2020-06-09 The proceedings of the 9th conference on Finite Volumes for Complex Applications Bergen June 2020 are structured in two volumes The first volume collects the focused invited papers as well as the reviewed contributions from internationally leading researchers in the field of analysis of finite volume and related methods Topics covered include convergence and stability analysis as well as investigations of these methods from the point of view of compatibility with physical principles Altogether a rather comprehensive overview is given on the state of the art in the field The properties of the methods considered in the conference give them distinguished advantages for a number of applications These include fluid dynamics magnetohydrodynamics structural analysis nuclear physics semiconductor theory carbon capture utilization and storage geothermal energy and further topics The second volume covers reviewed contributions reporting successful applications of finite volume and related methods in these fields The finite volume method in its various forms is a space discretization technique for partial differential equations based on the fundamental physical principle of conservation Many finite volume methods preserve further qualitative or asymptotic properties including maximum principles dissipativity monotone decay of free energy and asymptotic stability making the finite volume methods compatible discretization methods which preserve qualitative properties of continuous problems at the discrete level This structural approach to the discretization of partial differential equations becomes particularly important for multiphysics and multiscale applications The book is a valuable
