

Endocrine System (Chapter 9)

For the test

- be able to label all endocrine glands on a human diagram
- study & review your notes, homework, and the case study
- understand and be able to explain the information covered in the following questions.

1. Describe the function of the Endocrine System.

Along with the nervous system, it coordinates and directs the activity of the body's cells. Specific functions include: Second messenger system of the body that uses chemical messages (hormones) that are released into the blood to carry out: Reproduction, Growth and development, Mobilization of body defenses, Maintenance of much of homeostasis, Regulation of metabolism

2. Describe the difference in how Nervous and Endocrine Systems control the human body.
Nervous control is very fast using neurons to relay electrical messages to target tissues and endocrine control is much slower because it employs chemical messengers which are most often released into the blood to be transported to target tissues. Nervous control only works on a small area or target tissues, whereas endocrine control can be widespread because it uses the bloodstream and only a small amount of hormone is needed.
3. What are hormones? Describe the different types, actions, and functions.
Hormones are chemical messengers that are produced by specialized cells that secrete these hormones into extracellular fluids, and then the blood transfers hormones to target sites where they regulate the activity of other cells. Types of hormones include:
 - a. Amino acid-based hormones
 - i. Proteins
 - ii. Peptides
 - iii. Amines
 - b. Steroids – made from cholesterol (androgens, estrogens, and progesterone)
Steroid action is as follows: Diffuse through the plasma membrane of target cells, Enter the nucleus, Bind to a specific protein within the nucleus, Bind to specific sites on the cell's DNA, Activate genes that result in synthesis of new proteins
 - c. Prostaglandins – made from highly active lipids

Non-steroid hormones use this pathway: Hormone binds to a membrane receptor, Hormone does not enter the cell, Sets off a series of reactions that activates an enzyme, Catalyzes a reaction that produces a second messenger molecule, Oversees additional intracellular changes to promote a specific response

All of the following are effects of hormones in general:

- A. Changes in plasma membrane permeability or electrical state
- B. Synthesis of proteins, such as enzymes
- C. Activation or inactivation of enzymes
- D. Stimulation of mitosis

4. What is meant by "target cell"?
The specific tissue or cell that is only affected by a certain hormone.
