LAB: Human Population Growth & Demography

Objective: Predict how variables have different effects on population growth rates, calculate and graph changes for a given population. (AP Academic Standards, Environmental Science: III-B.)

Pre-Lab Background:

How will our population grow? If you were a demographer, you might be asked to determine how a population is likely to change in the future. You have learned that both the number of children per family and the age at which people have children affects the rate of population growth. But which factor has a greater effect? To explore this question, you will use age-structure diagrams - also called population pyramids. Use the one below as the basis for this lab.

Materials:

Calculator
Pen/Pencil

Colored Pencils/Markers
Ruler

Graph Paper
Initial Data (Provided)

Procedures:

1. In this activity you will calculate future population trends for an imaginary city called Doc Island. To compare how fertility variables may affect population growth, each group of students will test the effects of different assumptions. Assume the following about the population of this city.

Assumption About the Population

- Half the population is male and half is female.
- Every woman will have all of her children during a given five-year period of her life.
- Everyone who is born will live to the age of 85 and then die.
- No one will move into or out of the city.
