Natural Polymers and Biopolymers II Sylvain Caillol, 2021-05-05 BioPolymers could be either natural polymers polymer naturally occurring in Nature such as cellulose or starch or biobased polymers that are artificially synthesized from natural resources Since the late 1990s the polymer industry has faced two serious problems global warming and anticipation of limitation to the access to fossil resources One solution consists in the use of sustainable resources instead of fossil based resources Hence biomass feedstocks are a promising resource and biopolymers are one of the most dynamic polymer area Additionally biodegradability is a special functionality conferred to a material bio based or not Very recently facing the awareness of the volumes of plastic wastes biodegradable polymers are gaining increasing attention from the market and industrial community This special issue of Molecules deals with the current scientific and industrial challenges of Natural and Biobased Polymers through the access of new biobased monomers improved thermo mechanical properties and by substitution of harmful substances This themed issue can be considered as collection of highlights within the field of Natural Polymers and Biobased Polymers which clearly demonstrate the increased interest in this field We hope that this will inspire researchers to further develop this area and thus contribute to futures more sustainable society

Nanofertilizer Synthesis: Methods and Types Kamel A Abd-Elsalam, 2024-02-29 Nano Fertilizer Synthesis and Types discusses the production of a variety of nano fertilizers including biological chemical and mechanical types Nano fertilizers aid in nutrition control by increasing nutrient consumption efficiency as nutrients are bonded to nano dimensional adsorbents which in turn release nutrients considerably more slowly than traditional fertilizers As the nano fertilizer sector advances one approach is to concentrate on macro elements N P K as switching to nano fertilizers may result in significant environmental benefits by replacing the majority of these nutrients Furthermore the biosynthesis of nanomaterials employing bacteria algae yeast fungus actinomycetes and plants has opened up a new field of study for the creation of inorganic nanoparticles as environmentally benign fertilizers Because of the several fold increase in the surface to volume ratio of nano forms of nutrients and their appropriateness for foliar application where environmental losses are further decreased nano fertilizers may achieve higher efficiency However before nano fertilizers are manufactured and commercialized further research should be conducted to assess their impact for both humans and the environment While there are some nano fertilizer products available the nano fertilizer production industry still requires additional public and private sector support and development Nano Fertilizers Synthesis and Types presents the latest information highlights the benefits and impacts of each and provides a single volume resource to help effectively and efficiently identify options based

used for many years as a tool to make highly sensitive real time in situ measurements of wear and corrosion in metallic or ceramic materials The method consists of the controlled implantation of radioactive ions of limited decay time in a thin layer at the surface of the material The progressive abrasion of the material results in a decline in radioactivity which is followed to monitor material losses The application of RII to control the wear of polymers is potentially of interest but it has been lagging behind because of uncertainties related to possible changes in material properties during and after the implantation and to the exact shape of implantation profiles In this thesis we investigate these issues on two thermoplastic elastomers among which one contains radiation sensitive unsaturated bonds using as ions ^7Be ^7Li and Kr The results of the sample characterisation indicate that the ^7Be and ^7Li implantations under properly selected conditions do not induce significant modifications in the materials The implantation of a stack of polymer thin films and the activity measurements performed to determine the implantation profile are also presented The experimental results on the ion implantation profiles and the determination of calibration curves are presented and discussed in comparison with simulated results The results indicate that it is possible to predict the implantation profile by means of simulations This bodes well for the application of the RII method to polymer materials An experimental study is presented regarding the possible redistribution of the implanted ^7Be after implantation Since very few existing experimental techniques are able to detect light elements implanted in polymer targets at fluences less or equal to 10^{12} cm^{-2} with implantation depths of a few nm a new method is presented which implies the use of plasma etching techniques in order to remove layers of polymers and measuring the remaining activity after each step Our results indicate that a redistribution of the implanted ions takes place during the implantation process resulting in a scrambling of the initial implantation profile Nevertheless provided a suitable methodology be used wear measurements in polymers by using the RII method are still possible as we propose in the thesis
