

- **Gastrointestinal System:**

- **Enteral Feeding:** is used when a patient is unable to eat orally

- **Indications:**

- Inability to eat due to a medical condition (comatose, intubated, stroke)
- Inability to maintain adequate oral nutritional intake and need for supplementation due to increased metabolic demands
- Pathologies that cause difficulty swallowing or increase risk of aspiration

- **Clinical Presentation:**

- **Malnutrition:** decreased prealbumin, decreased total iron-binding capacity
- **Aspiration pneumonia:** food, vomit, etc. is inhaled into the lungs

- **Complications:**

- **Overfeeding:** results from infusion of a greater quantity of feeding than can be readily digested, which causes abdominal distention and nausea and vomiting

- ***Nursing Interventions:***

- **Check residual volume every 4-6 hours**

- It is the volume of fluid remaining in the stomach during feeding: if it is high, the patient is not digesting the food (let the doctor know **FIRST**)
- Ex: patient is on 60 mL, but you aspirate 100 mL

- **Follow protocol for slowing or withholding feeding for excess residual volume: let doctor know and they will tell you to hold the feeding**

- **Check the pump for proper operation and ensure feeding infused at correct rate** (probably would want to make sure that everything works and is running at the correct rate **BEFORE** you do something: assess before doing)

- **Diarrhea:** occurs secondary to concentration of feeding or its constituents

- ***Nursing Interventions:***

- **Slow the rate of feeding and notify the provider**
- **Consult with a dietitian**
- **Provide skin care and protection**
