

## Basic Algebra

The Basic Algebra section of the test measures your ability to perform basic arithmetic and Algebraic operations and to solve problems that involve these operations. The following exercises and examples provide a sample of the type of material that is tested in the Basic Algebra section. Only those students attempting to place into Math 110 or Math 111 will be given questions from the Basic Algebra section of the test.

### Basic Operations

**Example:** John's car insurance premium is \$1515.00. He has the option of making four equal payments but will be charged an additional \$25 processing fee. If he chooses the four-payment option, what is the amount of each payment?

**Solution:** The processing fee is added to the premium

$$\begin{array}{r} \$1515.00 \\ + \quad 25.00 \\ \hline \$1540.00 \end{array}$$

This amount is then divided by 4

$$\begin{array}{r} 385 \\ 4 \overline{)1540} \end{array}$$

Each payment will be \$385.00

**Exercise 1:** A shipment of 1344 CD's is to be packed into cartons containing 24 CD's each. How many cartons are necessary to ship these CD's?

**Exercise 2:** A loan of \$10,000.00 is to be paid off in 60 equal monthly payments. How much is each payment (excluding interest)?

**Exercise 3:** Susan's Cell phone provider charges her \$35.00 per month for the first 300 minutes of calls and \$0.70 for each minute over 300. If she uses 340 minutes of calls in a given month, how much will she be charged?

## Fractions

A fraction or rational number is of the form  $\frac{p}{q}$  where  $p$  and  $q$  are integers, and

$$q \neq 0$$

$p$  is called the numerator and  $q$  is called the denominator. The fraction is said to be reduced to lowest terms if  $p$  and  $q$  have no factors (other than 1) in common. The same number can be expressed as a fraction in many ways. These fractions

are called equivalent fractions:  $\frac{1}{4}, \frac{2}{8}, \frac{5}{20}, \frac{10}{40}, \frac{12}{48}$

Only the first fraction is in reduced form.

► To change from a mixed number to an improper fraction, multiply the whole number by the denominator of the fraction and add the result to the numerator of the fraction. This gives the numerator of the improper fraction.

**Example:**  $1\frac{2}{3} = \frac{5}{3} \quad (3 - (1 \times 3) + 2)$   
 $5\frac{3}{8} = \frac{43}{8} \quad (43 - (5 \times 8) + 3)$

► The product of two fractions  $\frac{a}{b} \times \frac{c}{d}$  is  $\frac{ac}{bd}$ . That is, multiply numerators to get the numerator of the product and multiply denominators to get the denominator of the product.

**Example:**  $\frac{2}{11} \times \frac{4}{9} = \frac{8}{99}$

$$= \frac{2}{11} \times \frac{6}{9} = \frac{12}{99}$$
