6. TO STUDY SQUAMOUS CELL FROM CHEEK CELLS (BUCCAL MUCOSA)

Aim: To examine the squamous cells from buccal mucosa.

Observation:

Stratified squamous epithelium of the hard palate. In this smear it shows a transition in the oral mucosa from a stratified squamous epithelium (on the right) to a stratified squamous para-keratinized epithelium (on the left). The flattened surface cells of the keratinized epithelium are devoid of nuclei. The layer of keratohyalin granule-containing cells is clearly visible in this type of epithelium. The flattened surface cells of the para-keratinized epithelium display the same characteristics as the keratinized cells, except they retain their nuclei, i.e., they are para-keratinized. In addition, note the paucity of keratohyalin granules present in the subsurface cells.
