

MICROSCOPE

Microscope

A microscope is a tool that helps us see things that are too small to see with our eyes. It's like a magic lens that makes tiny things look big.

There are different types of microscopes. A simple microscope, also called a magnifying glass, has one lens and is good for looking at big things like leaves and rocks. A compound microscope has two lenses and can make things look up to 1,000 times bigger!

To use a microscope, you first need to put a small piece of what you want to look at on a glass slide. Then, you put the slide on the microscope and look through the eyepiece. You can adjust the lens to make the image clearer.

Scientists use microscopes to study all kinds of things, like germs, cells, and insects. They can even use them to see the inside of our bodies and help doctors make us better.

Microscopes are also used in the industry and production. For instance, they can be used to check and inspect micro-components of computer chip, analyse ink of printed material, or inspect quality of food.

The microscope is a very useful tool that helps us discover new things about the world around us. Next time you see a microscope, think about all the tiny mysteries it can
