**Urban Drainage and Storage Practices** James C.Y. Guo, Wenliang Wang, Junqi Li, 2022-09-30 Urban Drainage and Storage Practices focuses on the latest developments in urban stormwater design methods using drainage and storage approaches for both water quality and quantity control. It covers both the conventional approaches to flood mitigation and low impact methods for stormwater quality enhancement. Theory, practice and modeling methods are presented to illustrate how to build a holistic stormwater drainage and storage system using urban open space and parks through multiple land use. Each chapter provides background theory, numerical experiments, illustrations and Excel spreadsheets that outline design and calculation procedures. All urban watersheds are modeled as a series of cascading planes to drain stormwater from upstream roofs and parking lots onto downstream grass areas and vegetative beds. The drainage system is designed as a three layer cascading system with various low impact units for micro events, conveyance elements for minor events and storage facilities for macro events. This book presents the theory and practice of designing and building a stormwater system, explains green approaches to designing and managing urban stormwater systems. This text is ideal for senior and graduate students studying urban hydrology, hydraulic engineering and water resource management. It will also be useful for engineers requiring a technical book with hands on practical examples.

Proceedings of International Conference on Remote Sensing for Disaster Management Peddada Jagadeeswara Rao, Kakani Nageswara Rao, Sumiko Kubo, 2018-06-23 The natural disasters are the killer agents which cannot be predicted even though we have modern technology. Every year in one place or another disasters striking which is devastating the area and surroundings leading to ecological disruption besides huge loss of life and property. India is vulnerable to cyclones, landslides, avalanches, earthquakes, floods, droughts, forest fires, epidemics etc. The 5700 km long coast of India with its dense population is vulnerable to cyclones, low depressions, tsunamis etc. The 2400 km long rugged Himalayan terrain is vulnerable to landslides, avalanches and earthquakes. India is not only vulnerable to natural disasters, it is also experiencing industrial accidents. The Bhopal Gas tragedy is one of the major man-made disasters in the world. The state of Andhra Pradesh has 970 km long coastline with two major rivers etc. The conference is conducted in Visakhapatnam, famous for industries and tourism. Recently several industrial accidents took place besides major natural disasters like Hudud etc. Disaster management shall be implemented from the grass root level in vulnerable areas to improve the capacity building so as to minimize the losses. The capacity building coupled with technology results in reduction of loss of life and property.

*Urban Hydrology, Watershed Management and Socio-Economic Aspects* Arup K. Sarma, Vijay P. Singh, Suresh A. Kartha, Rajib K. Bhattacharjya, 2016-10-25 The book brings together high quality research articles on advanced hydrological analysis advanced computational methods and the ecological and sociological aspects of urban watershed management under one umbrella The rapid pace of urbanization not accompanied by any farsighted holistic plan has reduced many cities in the developing world into multi hazard areas The most perceptible consequence of urbanization is the change in land use and land cover which in turn impacts hydrological systems Accordingly scientific studies on urban hydrology with due emphasis on ecological and sociological aspects under changing climate are vital to the appropriate design of urban landscapes and civil infrastructure works This book addresses precisely these issues offering a useful guide for environmentalists hydrologists and a broad range of socio economic scientists exploring the environmental vulnerabilities arising from urbanization

**Water Systems towards New Future Challenges** Helena M. Ramos, 2021-03-09 This book comprises components associated with smart water which aims at the exploitation and building of more sustainable and technological water networks towards the water energy nexus and system efficiency The implementation of modeling frameworks for measuring the performance based on a set of relevant indicators and data applications and model interfaces provides better support for decisions towards greater sustainability and more flexible and safer solutions The hydraulic management and structural models represent the most effective and viable way to predict the behavior of the water networks under a wide range of conditions of demand and system failures The knowledge of reliable parameters is crucial to develop approach models and therefore positive decisions in real time to be implemented in smart water systems On the other hand the models of operation in real time optimization allow us to extend decisions to smart water systems in order to improve the efficiency of the water network and ensure more reliable and flexible operations maximizing cost environmental and social savings associated with losses or failures The data obtained in real time instantly
