Humanity's Footprint Walter K Dodds, 2008-01-22 For the first time in history humans have exceeded the sustaining capacity of Earth's global ecosystems Our expanding footprint has tremendous momentum and the insidious explosion of human impact creates a shockwave that threatens ecosystems worldwide for decades possibly centuries Walter

K Dodds depicts in clear nontechnical terms the root causes and global environmental effects of human behavior. He describes trends in population growth, resource use, and global environmental impacts of the past two centuries such as greenhouse effects, ozone depletion, water pollution, and species extinctions and introductions. Dodds also addresses less familiar developments such as the spread of antibiotic-resistant genes in bacteria and the concentration of pesticides in the Arctic and other remote ecosystems. He identifies fundamental human activities that have irreversible effects on the environment and draws on recent social science and game theory results to explain why people use more than their share. Past behavior indicates that as resources grow scarce, humans will escalate their use of what remains instead of managing their consumption. Humanity's Footprint paints a lively but ultimately sobering picture of our environmental predicament. Dodds calls for a consilient approach to socioenvironmental restoration that draws on new thinking from across disciplines to develop sustainable solutions to global environmental problems.

Human Impacts on the Environment: Past, Present and Future Aaron Scott, 2019-06-17 The human impact on the environment is understood from the scientific study of anthropocene. It is a proposed epoch in Earth's history characterized by significant human influence on Earth's geology, ecosystems, and climate. The loss of biodiversity is due to an accelerated rate of species extinction. This is witnessed through the massive decline of marine phytoplankton in the world's oceans and decrease in algal biomass. Other aspects of human impacts include the large-scale migration of species, rise in global and ocean temperatures, etc. This is caused by human overpopulation, overconsumption, intensive fishing, and farming, etc. This book is a compilation of chapters that discuss the most vital concepts to understand the effects of human activities on the environment. It contains some path-breaking studies in this field. It will serve as a valuable source of reference for all experts and students.
