

# GENETICS

## Introduction

Genes are sections of DNA made up of specific sequences of nucleotides.

Alleles are different versions of the same gene.

Genotype: all alleles of an individual

Phenotype : characteristics or traits we can observe

In 1953, Watson and Crick deduced that the structure of DNA was a double helix.

The discovery of complementary base pairing revealed how information could be encoded in a molecule and how this information could be exactly duplicated during S phase of interphase.

## I. CELL CYCLE

The cell cycle is the series of events that take place in a cell leading to its division and duplication of its DNA (DNA replication) to produce two daughter cells.

### A. Interphase

Before a cell can enter cell division, it needs to duplicate its DNA.

#### DNA Replication.

The first step in DNA replication is to 'unzip' the double helix structure of the DNA molecule.
