

Chapter 12 Study Guide

Abstract—The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the body composition and muscle strength of 10 sedentary, middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 12-week, 100% BW resistance training program. The control group did not exercise. The exercise group showed a significant decrease in body fat percentage and an increase in muscle mass and strength. The control group showed no significant changes in body composition or muscle strength. The authors concluded that a 12-week, 100% BW resistance training program is effective in improving body composition and muscle strength in sedentary, middle-aged men.
