

Theoretical Probability

The **theoretical probability** of an event occurring is

$$\text{Theoretical probability} = \frac{\text{frequency of the event occurring}}{\text{total frequency of possible outcomes}}$$

Mutually exclusive events cannot happen at the same time.

For example, a fair die cannot land on a 3 and a 4 at the same time and a coin flip cannot land on heads and tails at the same time.

If an object (a coin, spinner, or dice for example) is described as fair, or conversely non-biased, the theoretical probability of each outcome is the same; the theoretical probability of flipping a tails on a fair coin is $\frac{1}{2}$, the **theoretical probability** of rolling a 2 on a fair 6-sided dice is $\frac{1}{6}$.
