- a) can travel through materials and mechanical waves cannot
- b) come in a range of frequencies and mechanical waves exist with only certain frequencies
- c) can travel through a region void of matter and mechanical waves cannot
- d) electromagnetic waves cannot transport energy and mechanical waves can transport energy
- e) electromagnetic waves have an infinite speed and mechanical waves have a finite speed

2. Consider the diagram below. It represents the beginnings of an electromagnetic spectrum below. Complete the diagram by labeling the following regions: ultraviolet, infrared, x-ray, radio wave, gamma radiation, and microwave radiation.

RADIO	MICRO	IR	Visible light	UV	XRAY	GAMMA
Long wavelength					Short wavelength	
Low f					High f	

3. Which region of the electromagnetic spectrum has the highest frequency?

right side (GAMMA)

4. Which region of the electromagnetic spectrum has the longest wavelength?

left side (RADIO)

5. Which region of the electromagnetic spectrum will travel with the fastest speed?

ALL TRAVEL AT SAME SPEED

6. It is known that electromagnetic waves with longer wavelengths have a greater ability to bend around obstacles that get in their path. This ability to bend around obstacles is referred to as diffraction. Electromagnetic waves with strong diffraction properties are used in communication. Which two regions of the spectrum have the greatest ability to diffract?

Quantum Information Meets Quantum Matter Bei Zeng, Xie Chen, Duan-Lu Zhou, Xiao-Gang Wen, 2019-03-28 This book approaches condensed matter physics from the perspective of quantum information science focusing on systems with strong interaction and unconventional order for which the usual condensed matter methods like the Landau paradigm or the free fermion framework break down Concepts and tools in quantum information science such as entanglement quantum circuits and the tensor network representation prove to be highly useful in studying such systems The goal of this book is to introduce these techniques and show how they lead to a new systematic way of characterizing and classifying quantum phases in condensed matter systems The first part of the book introduces some basic concepts in quantum information theory which are then used to study the central topic explained in

Part II local Hamiltonians and their ground states Part III focuses on one of the major new phenomena in strongly interacting systems the topological order and shows how it can essentially be defined and characterized in terms of entanglement Part IV shows that the key entanglement structure of topological states can be captured using the tensor network representation which provides a powerful tool in the classification of quantum phases Finally Part V discusses the exciting prospect at the intersection of quantum information and condensed matter physics the unification of information and matter Intended for graduate students and researchers in condensed matter physics quantum information science and related fields the book is self contained and no prior knowledge of these topics is assumed
