

# HOW MITSUBISHI CONQUERED THE 'SHAKE RATTLE AND ROLL' OF THE 4 CYLINDER ENGINE

The problems surrounding the automobile, such as pollution control and conservation of natural resources and energy, have meant that Mitsubishi has concentrated its technical and design resources into developing 4 cylinder engines to meet the exceptionally severe Japanese emission control regulations. This was achieved through the MCA (Mitsubishi Clean Air) system. However, another fundamental problem remained. While the 4 cylinder engine uses fewer resources and energy, and is more easily modified to control exhaust gas, by the very nature of its design, it produces more vibration and noise than 6 cylinder or 8 cylinder engines.

A smooth, quiet engine is one of the basic requirements for an automobile. Up till now the only answer has been to increase the number of cylinders to 6 or 8 or convert to a rotary engine. Neither solution saves on natural resources or energy use.

Mitsubishi set themselves the task of producing a 4 cylinder engine with the same smoothness and quietness as an 8. This meant re-thinking the fundamentals of engine technology. The result is the new Astron, incorporating the advanced principle of the silent shafts (counter balancing shafts).

## WHAT CAUSES 4 CYLINDER VIBRATION?

A 4 cylinder engine produces an engine shaking force equal to 1 ton. The vibration is caused by two factors. Firstly, in a 4 cylinder engine, two sets of pistons are operating in different directions at any one time. During

one rotation of the engine there are two cycles of upward/downward force. The problem is that these forces are not equal. This results in vertical vibration of the engine and is called 'vertical 2nd harmonic vibration'. It might be easier to think of this as the 'shake and rattle' of the engine.

There's a second force which causes vibration — 'the roll'. Besides the force (torque) which rotates the crankshaft, there is a torque produced by the explosion in the cylinders, which accelerates or decelerates the crankshaft revolution. This is called '2nd harmonic vibration in the rotating direction'. Because of the configuration of the engine this force is translated into a rolling vibration.

## SILENT SHAFT SOLVED THE PROBLEM

The basic principle Mitsubishi employed to solve the 'shake, rattle and roll' problem was to introduce into the engine two shafts which themselves set up a counter-balancing vibration which cancels out the engine vibration.

It was found that by setting up a pair of 'silent shafts' at optimum positions and rotating them at twice the speed of the crankshaft that vertical vibration could be cancelled. At the same time, by mounting the shafts at different heights on either side of the crankshaft, with the upper shaft rotating in the same direction and the lower shaft rotating in the opposite direction, the problem of rolling vibration was solved.
