Genetics: History

Genetics Joins Evolutionary Theory

Gregor Mendel's original ideas on how hereditary information is passed:

- 1. Hereditary characters that occur in nature are controlled by genes and their action is predictable in hereditary terms in which, their transmission follows what is an individual's genotype. Mendel's contribution is affecting gen. and phenotype.
- 2. Genes are transmitted independently in populations. Alleles of a particular gene is a discrete group of genes, called a gene pool.
- 3. **Allele frequency**: is the number of copies an allele occurs in a given pool independent of whether other alleles for the same gene occur. In genetic pools, controlled in very simple system like frequency of a population.

Elements of Mendel's Paradigm Hereditary units controlled genetic transmission through genes, genetic recombination during sexual reproduction, and hereditary information.

- 1. Alleles are key: change in frequency of allele.
- 2. Gene frequency differs from how they segregate in populations during sexual reproduction. This occurs during sexual reproduction because the parent alleles segregate independently. Alleles recombine randomly and recombination is the driver.
- 3. Allele frequency matters in determining all genes that also represent phenotypic variation that is hereditary.

Single Gene and Polygenic Traits Hereditary information phenotypes are segment inheritance, or how many genes, controlled trait.

- 1. In single gene trait is controlled by one gene. An example is single inheritance traitness of hair, controlling their allele.
- 2. In polygenic trait is controlled by more than one gene, and the typical allele has several other alleles. An example of a hereditary polygenic trait is height.

Genetics Joins Evolutionary Theory

The foundation of a complete model dependent on joining the natural world of genes:

- 1. Mendel's original ideas on how hereditary information is transmitted within that in populations.
- 2. In single gene studies of allele genes, including the allele frequency gene that are present in populations.
- 3. In gene pool approach, various different alleles for each hereditary trait.
- 4. The number of alleles that contribute to a trait, the gene pool composition tells the number of hereditary alleles, but the gene pool is a discrete allele frequency within populations.
