Genetics Joins Evolutionary Theory

Gregor Mendel's experiments with pea plants demonstrated segregation.

- 1. Mendel's experiments demonstrated that traits are controlled by genes and that these genes behave in predictable ways in crosses. These predictable differences in an individual's appearance, known as phenotypes, are affected by its genotype.
- 2. Genes are passed from one generation to the next in populations. Individuals in a population share a common group of genes, called a gene pool.
- 3. Allele frequency is the number of copies of an allele present in a gene pool. Mendel's experiments demonstrated that when alleles for the same gene occur in pairs, inheritance is largely based on their phenotype and genotype.

Examples of Mendel's "Pea Plants" Mendel's work revealed genetic inheritance patterns, genetic inheritance involving several generations, and hereditary patterns.

Single Gene and Polygenic Traits Mendel's work demonstrated that single genes are responsible for single traits, while multiple genes are responsible for multiple traits.

- 1. In single gene traits, inheritance is controlled by one gene. An example is the inheritance of traits such as height, which is controlled by one gene.
- 2. In polygenic traits, inheritance is controlled by many genes. An example is the inheritance of traits such as height, which is controlled by many genes.
