

base

a^n

exponent

The exponent n is also called Power. Multiplying a number or variable n times means that the number or variable is raised to the n^{th} power.

So if we say, $2 \times 2 \times 2 \times 2$, we can rewrite it into 2^4 which is read as 2 to the fourth power, or 2 to the power of four.

So, if we say 3×3 then that is still the same as 3^2 three squared or three to the power of 2 which will give you the answer of 9.

So from the examples, 2^4 , 2 is the base and 4 is the exponent.

So what is the base of 5^2 ? How about the exponent?

Okay, very good!

So what if we encounter variables with exponents?

For example: y^3

So, y times y times y times y times y times y is equal to y to 5^{th} power, y raised to 5^{th} power or y to the power of 5.

How about x^7 ?

So this would be $x \times x \times x$

Do you understand?

Okay! Now let's proceed to the laws of exponents.

1. The Product Law

Take a look at the expression

$$a^2 \times a^3$$

The exponents of each variable denotes how many times the base will multiply to itself. So in order to simplify it, first thing you do is:

$$= (a \times a) \times (a \times a \times a \times a \times a)$$

1. Expand the exponential form of each expression.

$$= a \times a \times a \times a \times a \times a \times a$$

2. Remove the grouping symbols.

$$= a^7$$

3. Count the number of times a is multiplied by itself, and write it in exponential form.

But this process is a bit longer. So by this time I would like to introduce the first law which is the Product Law. The product law denotes that,

$$a^2 \times a^3 = a^{2+3}$$

When multiplying two factors with the same base a , just copy the base a and add the exponents 2 and 3 together to get the solution.

$$a^2 \times a^3 = a^{2+3} = a^5$$

For example in the given expression a while ago which is $a^2 \times a^3$ just copy the base since they have similar base which is a and proceed adding their respective exponents which is 2 and 3. So the answer is a^5 which arrives to the same power from the first solution.

So what method would you prefer to use?

So another example:

$$x^2 \times x^3 = x^{2+3} = x^5$$

Next,

2. The Power of Power Law

Consider the expression $(2^2)^4$

$$= 2^2 \times 2^2 \times 2^2 \times 2^2$$

The expression means that you have to multiply 2^2 by itself four times.
