Geometry: Euclid and Beyond Robin Hartshorne, 2013-11-11 In recent years I have been teaching a junior senior level course on the classical geometries This book has grown out of that teaching experience I assume only high school geometry and some abstract algebra The course begins in Chapter 1 with a critical examination of Euclid's Elements Students are expected to read concurrently Books I IV of Euclid's text which must be obtained separately The remainder of the book is an exploration of questions that arise naturally from this reading together with their modern answers To shore up the foundations we use Hilbert's axioms The Cartesian plane over a field provides an analytic model of the theory and conversely we see that one can introduce coordinates into an abstract geometry The theory of area is analyzed by cutting figures into triangles The algebra of field extensions provides a method for deciding which geometrical constructions are possible The investigation of the parallel postulate leads to the various non Euclidean geometries And in the last chapter we provide what is missing from Euclid's treatment of the five Platonic solids in Book XIII of the Elements For a one semester course such as I teach Chapters 1 and 2 form the core material which takes six to eight weeks **Hadamard's Plane Geometry** Mark E. Saul, 2010-02-10 Jacques Hadamard among the greatest mathematicians of the twentieth century made signal contributions to a number of fields But his mind could not be confined to the upper reaches of mathematical thought He also produced a massive two volume work on plane and solid geometry for pre college teachers in the French school system In those books

Hadamard's style invites participation. His exposition is minimal, providing only the results necessary to support the solution of the many elegant problems he poses afterwards. That is, the problems interpret the text in the way that harmony interprets melody in a well-composed piece of music. The present volume offers solutions to the problems in the first part of Hadamard's work *Lessons in Geometry I: Plane Geometry*. Jacques Hadamard, Amer. Math. Soc. 2008, and can be viewed as a reader's companion to that book. It requires of the reader only the background of high school plane geometry which *Lessons in Geometry* provides. The solutions strive to connect the general methods given in the text with intuitions that are natural to the subject, giving as much motivation as possible as well as rigorous and formal solutions. Ideas for further exploration are often suggested as well as hints for classroom use. This book will be of interest to high school teachers, gifted high school students, college students, and those mathematics majors interested in geometry.

Optics for the New Millennium

Kamran M. Riaz, G. Vike Vicente, Daniel Wee, 2022-08-25. This textbook serves as a comprehensive manual on Optics that includes both didactics and assessment questions in an easy-to-read format. It provides an educational and entertaining resource that reinforces the relevance of the subject matter to modern clinical and surgical ophthalmology practice. The book offers a one-stop compendium for students studying for certification exams and for practicing ophthalmologists to review and learn Optics that will have relevance to their day-to-day practice. Chapters are written in a teaching-oriented style and include high-yield summaries, 375 original figures, and 190 review questions. The book is divided into three areas of focus: Written Exam Preparation, Oral Exam Preparation, and Clinical Practice. *Ophthalmic Optics for Surgical Practice*, *Optics for the New Millennium* is a must-have resource for ophthalmology residents as well as practicing ophthalmologists with clinical, surgical, and testable relevance.

Thinking Geometrically Thomas Q. Sibley, 2015-08-14. *Thinking Geometrically: A Survey of Geometries* is a well-written and comprehensive survey of college geometry that would serve a wide variety of courses for both mathematics majors and mathematics education majors. Great care and attention is spent on developing visual insights and geometric intuition while stressing the logical structure, historical development, and deep interconnectedness of the ideas. Students with less mathematical preparation than upper-division mathematics majors can successfully study the topics needed for the preparation of high school teachers. There is a multitude of exercises and projects in those chapters developing all aspects of geometric thinking for these students as well as for more advanced students. These chapters include Euclidean Geometry, Axiomatic Systems and Models, Analytic Geometry, Transformational Geometry, and Symmetry. Topics in the other chapters, including Non-Euclidean Geometry, Projective Geometry, Finite Geometry, Differential Geometry, and Discrete Geometry, provide a broader view of geometry. The different chapters are as independent as possible while the text still manages to highlight the many connections between topics. The text is self-contained, including appendices with the material in Euclid's first book and a high school axiomatic system as well as Hilbert's axioms. Appendices give brief summaries of the parts of linear algebra and multivariable calculus needed for certain chapters. While some chapters use the

language of groups no prior experience with abstract algebra is presumed The text will support an approach emphasizing dynamical geometry software without being tied to any particular software
