**Climate Change: Science, Strategies, and Solutions**

Eileen Claussen, 2022-05-16 It is the greatest environmental challenge of the 21st Century But what do we truly know about global climate change And what can we do about it Most of the world's top scientists agree that emissions of carbon dioxide and other greenhouse gases from human activities such as industrial processes fossil fuel combustion and land use changes are causing the earth to get warmer Impacts of this warming may include damage to our coastal areas accelerated rates of species loss altered agricultural patterns and increased incidences of infectious diseases The effects of climate change and efforts to mitigate climate change could also have substantial economic ramifications The book presents the latest research and analysis from prominent scientists economists academics and policy makers including Tom Wigley and Joel Smith who along with other authors of the Science and Impacts chapter explain the basic science of climate change the growing evidence that human activities are changing our climate and the impacts of these changes Eileen Claussen John Gummer Henry Lee and other authors of the Global Strategies chapter who describe what nations are or are not doing to address climate change and the state of international climate talks Robert Stavins John Weyant Ev Ehrlich and other economists who explain why economic analyses of climate policy are conducted why the projected costs of addressing climate change vary so widely among economic models and how changes driven by today's economy can influence climate policy Gov Jean Shaheen and other authors of the Innovative Solutions chapter who describe what state and local governments in the United States and multinational companies are doing to monitor and curb greenhouse gas emissions and Forest Reinhardt who offers business leaders advice on steering their companies on a path that is healthy for business as well as the global climate This publication has also been published in paperback please click here for details

*Nature-Based Solutions for agricultural water management and food security* Food and Agriculture Organization of the United Nations, 2019-03-14 Accessibility to clean and sufficient water resources for agriculture is key in feeding the steadily increasing world population in a sustainable manner Nature Based Solutions NBS offer a promising contribution to enhance availability and quality of water for productive purposes and human consumption while simultaneously striving to preserve the integrity and intrinsic value of the ecosystems Implementing successful NBS for water management however is not an easy task since many ecosystems are already severely degraded and exploited beyond their regenerative capacity Furthermore ecosystems are large and complex and the many stakeholders involved may have conflicting interests Hence implementation of NBS requires a structured and comprehensive approach that starts with the valuation of the services provided by the ecosystem The whole set of use and non use values in monetary terms provides a factual basis to guide the implementation of NBS which is ideally based on transdisciplinary principles i.e. complemented with scientific and case specific knowledge of the ecosystem in an adaptive decision making process that involves the relevant stakeholders This discussion paper evaluated twenty one NBS case

studies using a non representative sample to learn from successful and failed experiences and to identify possible causalities among factors that characterize the implementation of NBS The case studies give a minor role to valuation of ecosystem services an area for which the literature is still developing guidance Less successful water management projects tend to suffer from inadequate factual and scientific basis and uncoordinated or insufficient stakeholder involvement and lack of long term planning Successful case studies point to satisfactory understanding of the functioning of ecosystems and importance of multi stakeholder platforms well identified funding schemes realistic monitoring and evaluation systems and endurance of its promoters

Foundations of Environmental Economics Wolfgang Buchholz, Christiane Reif, Dirk Rübbelke, 2024-12-24 This textbook provides a solid introduction to the theoretical and empirical aspects of environmental economics and their links to environmental policy In this second edition all chapters have been updated and restructured and new sections have been added to reflect a greater focus on climate policy Starting from the need to balance the social costs of pollution against the financial costs of emission abatement the book discusses the major issues that arise in the context of environmental policy such as the potential and limitations of monetary valuation of the environment and in particular the contingent valuation method and the design of environmental policy With regard to the choice of environmental policy instruments the book focuses on the price based instruments preferred by economists i e environmental taxes and emissions trading discussing in detail not only their many advantages but also their drawbacks The second edition especially focuses on green industrial policy as a complementary measure to price based instruments the distributional effects of environmental policies and the resulting challenges for political feasibility Moreover the book deals extensively with international environmental problems in particular climate protection which is a global public good that will be underprovided when certain countries refuse to cooperate and contribute Approaches to overcoming this underprovision are described in far more detail than in the first edition both theoretically and empirically in particular by assessing the functions of the many international environmental agreements in this field Finally a new chapter considers adaptation strategies especially in the water sector as an additional pillar of climate policy

**Smart Solutions to Climate Change** Bjørn Lomborg, 2010-09-09 The failure of the Copenhagen climate conference in December 2009 revealed major flaws in the way the world's policymakers have attempted to prevent dangerous levels of increases in global temperatures The expert authors in this specially commissioned collection focus on the likely costs and benefits of a very wide range of policy options including geo engineering mitigation of CO2 methane and black carbon expanding forest research and development of low carbon energy and encouraging green technology transfer For each policy authors outline all of the costs benefits and likely outcomes in fully referenced clearly presented chapters accompanied by shorter critical alternative perspectives To further stimulate debate a panel of economists including three Nobel laureates evaluate and rank the attractiveness of the policies This authoritative and thought provoking book will challenge readers to form their own conclusions about the best ways to respond to global warming
