Irregular small space filled with a clear fluid causes further increase in the size of the follicle

Oocyte has attained its full size by the time of formation of the antrum begins

**Antrum**

- single cavity within the follicle formed from the fusion of small spaces filled with fluid during the proliferation of follicular cells

**Cumulus oophorus**

- eccentric mound or hillock
- its follicular cells is directly in relation to the ovum becomes radially arranged and form the **corona radiata**, separated from the ovum only by zona pellucida

**Membrana granulosa**

- regular continuous layer around the antral cavity formed by the stratified epithelium

**Call-Exner bodies**

- small accumulations of densely staining material that appear among the granulosa cells with a (+) PAS reaction seen to be extracellular in E/M

= **Mature Follicle (graafian)**

- large oocyte with large nucleus and prominent nucleoli
- large antrum is distended with fluid bound by membrane granulosa
- ovum has attained its full size surrounded by thick zona pellucida and a characteristic corona radiata

**Macula Pellucida (stigma)**

- tunica albuginea & theca folliculi become attenuated
- granulosa cells lining the mature follicle constitute a stratified cuboidal epithelium
- theca folliculi reaches its greatest development

**theca interna**
