Genetic Control Of Insect Pests G Davidson:

Genetic Control of Insect Pests G Davidson, 2012-12-02 Genetic Control of Insect Pests focuses on laboratory and field trials of genetic control methods of insects which entails the use of insects to control themselves. It particularly describes species specific and non polluting genetic methods that have the advantage over most other methods of being efficient when the target insect is in low density as the released insects have the capacity to search out the wild populations. Composed of nine chapters the core parts of the book cover the mass rearing sterilization and release of populations in the hope that these will mate with wild populations leading to fertility reduction and population elimination. The book also examines techniques that use naturally existing population incompatibilities and techniques which can result in population replacement rather than eradication with the intention to render such replacement populations harmless beforehand by genetic manipulation. This book is a valuable source of information for those who are searching for biological alternatives of insect pests control.

Biological and Biotechnological Control of Insect Pests Jack E. Rechcigl, Nancy A. Rechcigl, 1999-09-24 Pest and disease management continues to challenge the agricultural community. The rise in new pest and crop problems juxtaposed with public concern over pesticide use and more stringent environmental regulations creates the need for today's agricultural producers to stay current with new technologies for producing quality crops profitably. Biological and Biotechnological Control of Insect Pests presents an overview of alternative measures to traditional pest management practices utilizing biological control and biotechnology. The removal of some highly effective broad spectrum chemicals caused by concerns over environmental health and public safety has resulted in the development of alternative reduced risk crop protection products. These products less toxic to the environment and easily integrated into biological control systems target specific life stages or pest species. Predation recognized as a suitable long term strategy effectively suppresses pests in biotechnological control systems. Biological and Biotechnological Control of Insect Pests covers these topics and more. It explores the current approaches in alternative solutions such as biological control agents, parasites and predators, pathogenic microorganisms, pheromones, botanical insecticides, genetic control, genetic engineering of plants and biocontrol agents and government regulations for biocontrol agents and recombinant DNA technology. This book will be a useful resource to entomologists, agronomists, horticulturists and environmental scientists. *Genetic Control of Insect Pests* Davidson G., 1970

Genetically Engineered Organisms Deborah K. Letourneau, Beth Elpern Burrows, 2001-09-26 Genetic engineering suggests new avenues for constructing useful products but it also poses hazards to the health of the environment and the public. Delineating those hazards is complicated, difficult and important at every level of risk assessment and risk management decision making. Risk assessment and risk management may be further complicated. *Advances in Genetics*

, 1976-07-27 *Advances in Genetics* **Recent Developments in the Genetics of Insect Disease Vectors** William W. M.

Steiner, 1982 *Biological Insect Pest Suppression* H. C. Coppel, J. W. Mertins, 2012-12-06 The subject area embraced by the

term biological control in its classical sense is very broad indeed The term itself was apparently first used in 1919 by the late Harry S Smith and was then used specifically in reference to the suppression of insect populations by the actions of their indigenous or introduced natural enemies The California school of biological control specialists who followed in Smith's footsteps have traditionally differentiated natural biological control by indigenous natural enemies and applied biological control by man introduced natural enemies Subsequently the philosophy broadened beyond the original narrow concern with population suppression of insects and especially pest insects to embrace directed activities against mites or other arthropod pests various invertebrate and vertebrate pests weeds and organisms producing disease in humans or their domestic animals and plants The techniques used in these activities also multiplied beyond the original concern with natural enemies The subjects area discussed in this book is at the same time broader and more restricted than that covered in other books on biological control On the one hand the treatment here is restrictive in that with rare exception we have limited ourselves to dealing only with ideas and examples involving the suppression of insect pests through human activity or intervention in the environment
