EXPERIMENT No. 1

Objective:

To verify Thevenin's theorem in DC Network.

Apparatus:

- DC Power Supply (0-30V)
- Multimeter
- Resistor

Circuit Diagram:

Theory:

Thevenin's Theorem is used to simplify the analysis of complex networks into a standard equivalent network. Suppose that a complex network consists of number of sources and resistors connected in any manner, then according to this theorem,

"Any network can be replaced by a single source V_{th} in series with a single resistance R_{th} ."

V_{th} or V_{oc} is the open-circuit voltage across the terminals A and B i.e., find the voltage that the network produces across the two terminals with an open-circuit between A and B. This voltage is called the Thevenin Equivalent Voltage. R_{th} is the open-circuit resistance across the terminals A and B but with all the sources killed in the network. This resistance is called the Thevenin Equivalent Resistance. For R_{th} , voltage sources are replaced by short circuits and current sources are replaced by open circuits.

The output of the Thevenin and actual circuits is the same. This condition is called the **Equivalent Equivalence** from the viewpoint of the Two Output Terminals. Although Thevenin Equivalent circuit is not the same as its original network, it acts as same in terms of the output voltage and current.
