Strahler, 1974 **Ecology, Environmental Science and Conservation 2nd Edition** JS Singh | SP Singh | SR Gupta | Rishikesh Singh, The updated second edition of the book offers an innovative synthesis of fundamental ecological concepts and practical applications in environmental science and conservation. It is the first textbook on the subject by eminent Indian researchers and presents most of the examples from the Indian subcontinent. The book covers a wide range of topics including fundamental concepts required to comprehend the physical environment, population dynamics, community characteristics, patterns and gradients in biodiversity, ecosystem functioning and dynamics, and the study of biogeography. It also addresses applied topics such as environmental pollution, impact assessment, natural resource management, biodiversity conservation, ecosystem services, global climate change, ecosystem restoration, urban ecology, and sustainable development. The main issues are discussed within the sustainability framework, considering humans as part of ecosystems and recognising that sustainable development requires the integration of ecology with social sciences for policy formulation and implementation. The updated edition of the book aligns with the National Education Policy 2020 and the revised UGC

The Theory of Ecological Communities Mark Vellend, 2020-09-15 A plethora of different theories models and concepts make up the field of community ecology Amid this vast body of work is it possible to build one general theory of ecological communities What other scientific areas might serve as a guiding framework As it turns out the core focus of community ecology understanding patterns of diversity and composition of biological variants across space and time is shared by evolutionary biology and its very coherent conceptual framework population genetics theory The Theory of Ecological Communities takes this as a starting point to pull together community ecology's various perspectives into a more unified whole Mark Vellend builds a theory of ecological communities based on four overarching processes selection among species drift dispersal and speciation These are analogues of the four central processes in population genetics theory selection within species drift gene flow and mutation and together they subsume almost all of the many dozens of more specific models built to describe the dynamics of communities of interacting species The result is a theory that allows the effects of many low level processes such as competition facilitation predation disturbance stress succession colonization and local extinction to be understood as the underpinnings of high level processes with widely applicable consequences for ecological communities Reframing the numerous existing ideas in community ecology The Theory of Ecological Communities provides a new way for thinking about biological composition and diversity
