Computer Programming Examples for Chemical Engineers George Ross, 1987. Written by a chemical engineer rather than by a computer scientist, this book fills the gap between texts which teach computer languages or programming methods and chemical engineering texts which omit details of writing programs. In order to write a computer program and get it to work, general theoretical principles are not enough; one has to actually do the job. This is done in each case by first taking the reader through a manual calculation, then presenting a computer program to perform the same task. Explanation of how the program operates is given in some detail. Topics discussed in this way include computer flowsheeting, interpretation and accessing of results and physical data, forward feed, multi-effect evaporation, binary distillation, linear programming, introduction to finite differences with simple heat exchanger example, steady state, multi-dimensional heat conduction, unsteady state heat conduction, solution of automatic control problems using finite differences. In each case, the necessary theory is fully introduced. The programs are written in BASIC, an easily learnt, moderately powerful language available on both mainframe and desk top computers.
