Quantum Systems under Gravitational Time Dilation Magdalena Zych, 2017-02-06 This thesis introduces a new theoretical tool to explore the notion of time and temporal order in quantum mechanics the relativistic quantum clock framework It proposes novel thought experiments showing that proper time can display quantum features e g when a clock runs different proper times in superposition The resulting new physical effects can be tested in near future laboratory experiments with atoms molecules and photons as clocks The notion of time holds the key to the regime where quantum theory and general relativity overlap which has not been directly tested yet and remains largely unexplored by the theory The framework also applies to scenarios in which causal relations between events become non classical and which were previously considered impossible to address without refuting quantum theory The relativistic quantum clock framework offers new insights into the foundations of quantum theory and general relativity      **Quantum Information Meets Quantum Matter** Bei Zeng, Xie

Chen,Duan-Lu Zhou,Xiao-Gang Wen,2019-03-28 This book approaches condensed matter physics from the perspective of quantum information science focusing on systems with strong interaction and unconventional order for which the usual condensed matter methods like the Landau paradigm or the free fermion framework break down Concepts and tools in quantum information science such as entanglement quantum circuits and the tensor network representation prove to be highly useful in studying such systems The goal of this book is to introduce these techniques and show how they lead to a new systematic way of characterizing and classifying quantum phases in condensed matter systems The first part of the book introduces some basic concepts in quantum information theory which are then used to study the central topic explained in Part II local Hamiltonians and their ground states Part III focuses on one of the major new phenomena in strongly interacting systems the topological order and shows how it can essentially be defined and characterized in terms of entanglement Part IV shows that the key entanglement structure of topological states can be captured using the tensor network representation which provides a powerful tool in the classification of quantum phases Finally Part V discusses the exciting prospect at the intersection of quantum information and condensed matter physics the unification of information and matter Intended for graduate students and researchers in condensed matter physics quantum information science and related fields the book is self contained and no prior knowledge of these topics is assumed *Curriculum Review* ,1984 **MATLAB for**
