Ge Echopac Manual:

Manual of 3D Echocardiography Eduardo Casas Rojo, Covadonga Fernandez-Golfin, José Luis Zamorano, 2017-03-15

This book is a practical guiding manual to explain critical clinical practice in three dimensional 3D echocardiography. The use of this technology has been limited to certain pioneer imaging units but with the advent of lower cost hardware it is spreading and reaching more users that will start to use it often without previous experience or formal academic training. This title provides these readers with a full review of the features, clinical indications and methodological aspects of 3D echo in a practical how to do it way. 3D echocardiography techniques are becoming more diverse as they are applied to transthoracic and transesophageal studies. 3D wall motion tracking, fusion of echocardiographic and fluoroscopy navigation, fusion of wall motion tracking and coronary tomography. All these aspects are described and explained deeply in this book.

Functional Imaging and Modeling of the Heart Hans van Assen, Peter Bovendeerd, Tammo Delhaas, 2015-06-20. This book constitutes the refereed proceedings of the 8th International Conference on Functional Imaging and Modeling of the Heart held in Maastricht, The Netherlands in June 2015. The 54 revised full papers were carefully reviewed and selected from 72 submissions. The focus of the papers is on following topics: function, imaging, models of mechanics and models of electrophysiology.

Basic And New Aspects Of Gastrointestinal Ultrasonography Svein Odegaard, Odd Helge Gilja, Hans Gregersen, 2005-03-28. This book is an introduction for students and young doctors at the beginning of their career in diagnostic ultrasonography. It also presents the latest in innovations and techniques in gastrointestinal ultrasonography. The reader will find basic aspects of ultrasonography as well as highly advanced technical and research papers. The first category will be easy to understand for most readers. The second category may require some preparation from the student. All advanced papers represent the frontiers of knowledge. The first few chapters deal with the basic principles of ultrasound and its use in tissue characterization. They are followed by chapters on the use of ultrasound for the characterization of tissue biomechanics and on novel techniques such as 3D ultrasound and hydrosonography. The clinical applications are outlined in the last few chapters of the book.

Advanced Quantitative Indexes in Cardiovascular Magnetic Resonance Imaging Xiaoyue Zhou, Rob J. Van Der Geest, Yucheng Chen, Peng Hu, Ming Yen Ng, 2024-08-28 In the past decades advanced quantitative indexes obtained by cardiovascular magnetic resonance imaging CMRI such as myocardial strain myocardial T1 ECV T2 T2 relaxation value myocardial blood flow quantification index and hemodynamics indexes have been proposed as an alternative for non invasive quantitative evaluation in various cardiovascular diseases Those quantitative indexes have been proven to be more sensitive in assessing the early change of myocardial tissue ventricular function or hemodynamics compared to the conventional qualitative methods However there are many challenges in the accurate measurement of those indexes as well as the evaluation of their clinical significance in the diagnosis and prognosis of a certain disease Besides quality control and standardization of those indexes become crucial when promoting them into clinical practice This Research Topic will offer comprehensive reviews and original research articles of the newly emerged quantitative CMRI methods and the clinical insights of the diagnostic and prognostic value of those advanced CMRI indexes CMRI techniques such as myocardial strain analysis quantitative myocardial tissue mapping 2 dimensional 4 dimensional flow quantification and quantitative perfusion will be of our interest The aim of this Research Topic will be to highlight the promising technical improvements in the accurate measurement of the CMRI indexes and or the added value of those indexes in disease diagnosis and prognosis Meanwhile quality control and standardization of the advanced CMRI indexes in multi centre multi vendor research projects will be discussed **Health technology assessment in cardiovascular diseases** Komal Shah, Deepak Saxena, Kamal

Sharma,2023-03-01 *Novel approaches in cardiac imaging* Giuseppe Pannarale,Artur Dziewierz,Francesco Pelliccia,Carlo Gaudio,2023-06-30 **The right ventricle in volume or pressure overload** Aleksandra

Trzebiatowska-Krzynska,2019-01-07 This study is inspired by the gap in knowledge regarding the timing of cardiac surgery and interventions in adult patients with congenital heart disease There are many parameters used assessing right ventricular function however most of them have pitfalls Understanding the pathomechanisms by which the heart adapts to congenital defects is probably key to find the answer when it is time to intervene and start discussing treatment options Heart defects are the most frequently occurring congenital disorders Less than 50% of individuals with moderate to severe congenital heart defects e g transposition of the great arteries TGA or tetralogy of Fallot TOF survive to adulthood without intervention Advances in cardiac surgery and better identification of individuals at risk for sudden cardiac death have increased survival rates Currently more than 96% of patients with congenital heart disease survive to at least 16 years of age most undergo corrective surgery but are not cured and only a few have normal physiology and anatomy In many cases the heart must develop mechanisms of adaptation to the changed conditions after surgery Consequently correction of the defect creates residual disease with a risk of future complications To prevent clinical deterioration and to identify the development of complications patients need lifelong regular follow up The choice of followup modalities depends on the cardiac malformation The right ventricle RV plays an important role as it is often part of the defect or is influenced by the surgery In the past research was focused on assessment of left ventricular function LV and the RV was the forgotten ventricle Observations and studies in the last few decades brought increased interest into the RV and revealed the importance of the RV in the prognosis of various cardiac diseases An understanding of RV morphology pathophysiology and adaptive mechanisms is crucial for further studies of prognosis as well as for research linked to the use of particular diagnostic modalities When the RV is exposed to increased pressure load e g in atrially corrected transposition of the great arteries TGA adaptation affects the cavity volume as well as the wall thickness When the RV is volume overloaded adaptation involves enhancement of the RV cavity volume while the wall thickness often remains unchanged under long time RV ejection fraction RVEF gives some information about changes in RV function but information on myocardial contractility and contractile reserve is also needed New functional parameters such as strain also known as myocardial deformation provide some information about intrinsic myocardial function In Paper I we studied functional parameters such as ejection fraction and strain radial and longitudinal strain for both ventricles in patients with Tetralogy of Fallot TOF and TGA Longitudinal RV strain was depressed in both patient groups in comparison with that in healthy individuals and there were additional differences between the two patient groups In Paper II we validated three dimensional echocardiography 3DEcho against the cardiac magnetic resonance CMR gold standard The study population was limited to patients with TOF In general 3DEcho underestimated RV volumes but was able to identify patients with RV dilatation on CMR with high sensitivity RV longitudinal free wall strain measured by CMR

with a cut off set at 14% identified patients with depressed exercise capacity and low peak oxygen uptake In Paper III we studied a new CMR method to quantify and visualise turbulent flow in the heart and vessels Turbulent flow can be harmful to tissue blood cells and endothelium and can contribute to tissue remodeling In patients with TOF turbulent flow can be seen as variance in 2DEcho color Doppler In CMR increased turbulent kinetic energy TKE could be seen with four dimensional flow The RV TKE was increased in patients with TOF with pulmonary regurgitation compared with that in healthy controls In Paper IV we validated knowledge based reconstruction KBR a novel method to calculate RV volume against CMR in patients with various types of congenital heart defects Two dimensional echocardiogram based three dimensional RV reconstruction is a relatively uncomplicated method that creates a three dimensional RV model based on a limited number of predefined points of interest RV structures such as tricuspid annulus RV free wall or pulmonary valve KBR showed good agreement with CMR intraclass correlation coefficient 0.84 for RV end diastolic volume and 0.89 for ejection fraction but tended to underestimate RV volumes which is in line with other methods based on ultrasound Conclusions 3DEcho is an evolving modality that is able to identify patients with RV dilatation It can be used clinically for the follow up of patients with congenital heart diseases especially those with mildly to moderately dilated RVs When an intervention seems likely 3DEcho results should be verified by CMR CMR derived measurements of longitudinal and radial strain provide a new understanding of RV remodeling and ventricular interdependence in patients with TOF and TGA Depressed longitudinal strain may indicate a risk of depressed exercise capacity and in patients with TGA clinical deterioration Further studies in larger populations of patients with congenital heart defects are needed as the altered RV morphology in such patients makes quantitative assessment especially challenging

Novel Biomarkers for Heart Disease Michael Lichtenauer, 2020-12-28 Cardiac biomarkers such as troponins and natriuretic peptides have made a great impact on clinical decision making as well as improving our understanding of molecular mechanisms of different disease conditions However the biomarkers that are currently in use do not reflect all the multiple disease pathways that are involved in a broad spectrum of cardiac disease conditions ranging from acute coronary syndrome to heart failure and heart failure with preserved ejection fraction HFpEF to pulmonary hypertension or arrhythmias In this Special Issue we will provide an overview of the current developments in the field of biomarker research beginning with research on molecular pathways and cellular communication e.g. microRNA up to the clinical use of biomarkers
