

## POGIL - Gene Expression: Transcription

*How is mRNA synthesized and what message does it carry?*

### Why?

Deoxyribonucleic DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular

organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

### Model 1 - Transcription

#### 1. Consider the eukaryotic cell in Model 1.

a. Where in the cell is the DNA found?

b. Where in the cell does transcription take place?

#### 2. Refer to Model 1.

a. What polymer is synthesized during transcription?

b. What monomers are used to construct this polymer and where are they found?

#### 3. According to Model 1, what enzyme is required for transcription? (Hint: Think about how enzymes are named. What ending is used for enzyme names?)

#### 4. Refer to Model 1.

a. What is the base-pair rule for a DNA strand matching an RNA strand?

b. Compare this base-pair rule with that of two DNA strands.

#### 5. Which strand of the DNA contains the "blueprint" for the pre-mRNA?

#### 6. Consider Model 1.

a. In which direction is the DNA molecule read? \_\_\_\_\_

b. The DNA strand and pre-mRNA strand are anti-parallel. With this in mind label the 3' and 5' ends of the pre-mRNA strand in Model 1.

c. In which direction is the pre-mRNA molecule constructed? \_\_\_\_\_

7. Before printing presses were available, books had to be transcribed in order to share the information

## Gene Expression Transcription Pogil Packet Answers:

Gene Transcription R. J. White, 2009-04-01 Transcription is the focus of much cutting edge research as befits its essential place in biology The established link between defects in gene transcription and many human disorders has fuelled considerable activity in the biomedical arena particularly cancer research This concentration of attention has uncovered a myriad of factors involved in transcription and the literature is now rife with jargon and complexity Gene Transcription Mechanisms and Control aims to demystify the subject for a non expert audience providing a guided tour around the complex machinery of the transcriptional apparatus and discussing how the various factors achieve their functions By focusing on general principles and illustrating these with a select group of examples many of which are linked to human diseases the author conveys the intricacies of transcriptional control in an accessible manner With the first chapter presenting an overview of gene expression this is a stand alone text ideal for advanced level undergraduates and postgraduates in biology biochemistry and medical sciences It will also appeal to research scientists who require a broad current perspective on this rapidly moving and complex field Provides a broad and accessible introduction to gene transcription Up to date coverage of the major topics in a rapidly evolving field Illustrates the links between aberrant transcription and human disease Explains the jargon associated with transcription factors

Gene Transcription Steve J. Higgins, B. David Hames, 2023 This volume provides detailed practical guidance on some of the most important techniques relating to gene transcription The mechanisms of this research should be of interest to researchers in cell and molecular biology

Gene Expression and Regulation Mr. Rohit Manglik, 2024-06-24 Examines mechanisms of gene expression including transcription translation and epigenetic regulation with applications in molecular biology

*Gene Expression* M. Karin, 1993-12-01 This book is the first volume in a new series Progress in Gene Expression The control of gene expression is a central most topic in molecular biology as it deals with the utilization and regulation of gene information As we see huge efforts mounting all over the developed world to understand the structure and organization of several complex eukaryotic genomes in the form of Gene Projects and Genome Centers we have to remember that without understanding the basic mechanisms that govern the use of genetic information much of this effort will not be very productive Fortunately however research during the past seven years on the mechanisms that control gene expression in eukaryotes has been extremely successful in generating a wealth of information on the basic strategies of transcriptional control Although regulation of gene expression is exerted at many different levels much of the emphasis in this series will be on transcriptional control A future volume however will deal with other levels of regulation The progress in understanding the control of eukaryotic transcription can only be appreciated by realizing that seven years ago we did not know the primary structure of a single sequence specific transcriptional activator and those whose primary structures were available e.g. homeo domain proteins were not yet recognized to function in this capacity
