

# General structure of an operon

An operon is made up of 4 basic DNA components:

**Promoter** — a nucleotide sequence that enables a gene to be transcribed. The promoter is recognized by RNA polymerase, which then initiates transcription.

**Regulator** — These genes control the operator gene in cooperation with certain compounds called inducers and corepressors present in the cytoplasm.

**Operator** — a segment of DNA that a repressor binds to. It is classically defined in the lac operon as a segment between the promoter and the genes of the operon.

**Structural genes** — the genes that are co-regulated by the operon.
