

Genetic Mapping and the Three-Point Testcross

A two-strand double crossover that spans the middle pair of alleles in a triple heterozygote results in a reciprocal exchange of the middle pair of alleles between the two participating chromatids.

Looking at the linked genes in corn:

- *lz*: lazy or prostrate growth
- *gl*: glossy leaf
- *su*: sugary endosperm

A cross is done using multiply heterozygous parental genotype:

$$\begin{array}{ccc} Lz & Gl & Su \\ \hline lz & gl & su \end{array} \times \begin{array}{l} \text{Homozygous} \\ \text{recessive (usually} \\ \text{not written)} \end{array}$$
