Gel Electrophoresis is useful in identifying the size of an unknown DNA fragment. Scientists compare unknown DNA samples to a control sample called a **marker sample** or a "**ladder**". The ladder sample contains several known lengths of DNA.

In the example below, the ladder contains known fragments of DNA with lengths 100, 300, 500, 800, 1000, and 2000 base pairs long.

Wells/Lanes #	1	3	5	7
Ladder	?	?	?	?

Gel Electrophoresis Chamber for Approximately 30 Minutes

Because we know the ladder's standard fragment size, we can use this to estimate the unknown fragments in lanes 3, 5, and 7.

In Lane 3, there are at least 2 different fragments: one has a length of between 1000 and 2000 bp. One has a length close to 800 bp.

In Lane 5, there are at least 3 different DNA fragments. One is about 800 bp, one is between 300 and 500 (estimate 400), and one is about 300 bp.

In Lane 7, there is at least 1 fragment that is close to 100 base pairs in length.

It is important to note what DNA gel electrophoresis cannot do. When reading a DNA gel's bands, you cannot know if a sample has 2 or more different fragments of the same length. In the gel above, lane 7 might have 1, 2, 3, 4, or many different DNA fragments with different sequences of very similar length (around 100 bp). There is no way to distinguish between different DNA fragments with the same length using just DNA gel electrophoresis.
