Chimpanzee Kevin D. Hunt, 2020-08-20 The chimpanzee is one of our planet's best loved and most instantly recognisable animals Splitting from the human lineage between four and six million years ago it is along with its cousin the bonobo our closest living relative sharing around 94% of our DNA First encountered by Westerners in the seventeenth century virtually nothing was known about chimpanzees in their natural environment until 1960 when Jane Goodall travelled to Gombe to live and work with them Accessibly written yet fully referenced and uncompromising in its accuracy and comprehensiveness this book encapsulates everything we currently know about chimpanzees from their discovery and why we study them to their anatomy physiology genetics and culture The text is beautifully illustrated and infused with examples and anecdotes drawn from the author's thirty years of primate observation making this a perfect resource for students of biological anthropology and primatology as well as non specialists interested in chimpanzees

is the first comparative perspective on gorilla populations throughout their range *Theistic Evolution* J. P. Moreland, Stephen C. Meyer, Christopher Shaw, Ann K. Gauger, Wayne Grudem, 2020-06-20 Winner of the ECPA Book of the Year Award for Bible Reference Works Many prominent Christians insist that the church must yield to contemporary evolutionary theory and therefore modify traditional biblical ideas about the creation of life They argue that God used albeit in an undetectable way evolutionary mechanisms to produce all forms of life Featuring two dozen highly credentialed scientists philosophers and theologians from Europe and North America this volume contests this proposal documenting evidential logical and theological problems with theistic evolution making it the most comprehensive critique of theistic evolution yet produced Explains why theistic evolution is not congruent with a biblical worldview Features nineteen essays written by well known experts in their fields Designed to be used as a textbook for courses on religion and evolution Accessible for those without expertise in the subject **The Evolution of Man** Ernst Haeckel, 1906 **Evolution in the Light of Modern Knowledge**, 1925 **The Evolution of Man** Ernst Heinrich Philipp August Haeckel, 1910 THE PREDICAMENT OF EVOLUTION GEORGE MCCREADY PRICE, 1925 *A Natural History of Families* Scott Forbes, 2007-01-02 Why do baby sharks hyenas and pelicans kill their siblings Why do beetles and mice commit infanticide Why are twins and birth defects more common in older human mothers A Natural History of Families concisely examines what behavioral ecologists have discovered about family dynamics and what these insights might tell us about human biology and behavior Scott Forbes's engaging account describes an uneasy union among family members in which rivalry for resources often has dramatic and even fatal consequences In nature parents invest resources and control the allocation of resources among their offspring to perpetuate their genetic lineage Those families sometimes function as cooperative units the nepotistic and loving havens we choose to identify with In the natural world however dysfunctional familial behavior is disarmingly commonplace While explaining why infanticide fratricide and other seemingly antisocial behaviors are necessary Forbes also uncovers several surprising applications to humans Here the conflict begins in the moments following conception as embryos struggle to wrest control of pregnancy from the mother and to wring more nourishment from her than she can spare thus triggering morning sickness diabetes and high blood pressure Mothers in return often spontaneously abort embryos with severe genetic defects allowing for prenatal quality control of offspring Using a broad sweep of entertaining examples culled from the world of animals and humans A Natural History of Families is a lively introduction to the behavioral ecology of the family **Building Bones: Bone Formation and Development in Anthropology** Christopher J. Percival, Joan T. Richtsmeier, 2017-02-23 Bone is the tissue most frequently recovered archaeologically and is the material most commonly studied by biological anthropologists who are interested in how skeletons change shape during growth and across evolutionary time This volume brings together a range of contemporary studies of bone growth and development to highlight how cross disciplinary research and new methods can enhance our anthropological understanding of skeletal

variation The novel use of imaging techniques from developmental biology advanced sequencing methods from genetics and perspectives from evolutionary developmental biology improve our ability to understand the bases of modern human and primate variation Animal models can also be used to provide a broad biological perspective to the systematic study of humans This volume is a testament to the drive of anthropologists to understand biological and evolutionary processes that underlie changes in bone morphology and illustrates the continued value of incorporating multiple perspectives within anthropological inquiry , Evolutionary Developmental Biology Brian K. Hall, 2012-12-06 Although evolutionary developmental biology is a new field its origins lie in the last century the search for connections between embryonic development ontogeny and evolutionary change phylogeny has been a long one Evolutionary developmental biology is however more than just a fusion of the fields of developmental and evolutionary biology It forges a unification of genomic developmental organismal population and natural selection approaches to evolutionary change It is concerned with how developmental processes evolve how evolution produces novel structures functions and behaviours and how development evolution and ecology are integrated to bring about and stabilize evolutionary change The previous edition of this title published in 1992 defined the terms and laid out the field for evolutionary developmental biology This field is now one of the most active and fast growing within biology and this is reflected in this second edition which is more than twice the length of the original and brought completely up to date There are new chapters on major transitions in animal evolution expanded coverage of comparative embryonic development and the inclusion of recent advances in genetics and molecular biology The book is divided into eight parts which place evolutionary developmental biology in the historical context of the search for relationships between development and evolution detail the historical background leading to evolutionary embryology explore embryos in development and embryos in evolution discuss the relationship between embryos evolution environment and ecology discuss the dilemma for homology of the fact that development evolves deal with the importance of understanding how embryos measure time and place both through development and evolutionarily through heterochrony and heterotrophy and set out the principles and processes that underlie evolutionary developmental biology With over one hundred illustrations and photographs extensive cross referencing between chapters and boxes for ancillary material this latest edition will be of immense interest to graduate and advanced undergraduate students in cell developmental and molecular biology and in zoology evolution ecology and entomology in fact anyone with an interest in this new and increasingly important and interdisciplinary field which unifies biology
