Basic Concepts of String Theory Ralph Blumenhagen, Dieter Lüst, Stefan Theisen, 2012-10-03 The purpose of this book is to thoroughly prepare the reader for research in string theory at an intermediate level As such it is not a compendium of results but intended as textbook in the sense that most of the material is organized in a pedagogical and self contained fashion Beyond the basics a number of more advanced topics are introduced such as conformal field theory superstrings and string dualities the text does not cover applications to black hole physics and cosmology nor strings theory at finite temperatures End of chapter references have been added to guide the reader wishing to pursue further studies or to start research in well defined topics covered by this book CliffsNotes Algebra I Practice Pack Mary Jane Sterling, 2010-02-08

Advanced Modern Algebra Joseph J. Rotman, 2010-08-11 This book is designed as a text for the first year of graduate algebra but it can also serve as a reference since it contains more advanced topics as well This second edition has a different organization than the first It begins with a discussion of the cubic and quartic equations which leads into permutations group theory and Galois theory for finite extensions infinite Galois theory is discussed later in the book The study of groups continues with finite abelian groups finitely generated groups are discussed later in the context of module theory Sylow theorems simplicity of projective unimodular groups free groups and presentations and the Nielsen Schreier theorem subgroups of free groups are free The study of commutative rings continues with prime and maximal ideals unique factorization noetherian rings Zorn's lemma and applications varieties and Gröbner bases Next noncommutative rings and modules are discussed treating tensor product projective injective and flat modules categories functors and natural transformations categorical constructions including direct and inverse limits and adjoint functors Then follow group representations Wedderburn Artin theorems character theory theorems of Burnside and Frobenius division rings Brauer groups and abelian categories Advanced linear algebra treats canonical forms for matrices and the structure of modules over PIDs followed by multilinear algebra Homology is introduced first for simplicial complexes then as derived functors with

applications to Ext Tor and cohomology of groups crossed products and an introduction to algebraic K theory Finally the author treats localization Dedekind rings and algebraic number theory and homological dimensions The book ends with the proof that regular local rings have unique factorization Publisher s description *College Algebra* Max A. central area of algebraic number theory that treats quadratic forms and the structure of the rings of integers in algebraic number fields It is an ideal topic to lead college students as well as some talented and motivated high school students to a better appreciation of the power of mathematical technique Even at the specific level of quadratic diophantine equations there are unsolved problems and the higher degree analogues of Pell s equation particularly beyond the third do not appear to have been well studied In this focused exercise book the topic is motivated and developed through sections of exercises

which will allow the readers to recreate known theory and provide a focus for their algebraic practice There are several explorations that encourage the reader to embark on their own research A high school background in mathematics is all that is needed to get into this book and teachers and others interested in mathematics who do not have or have forgotten a background in advanced mathematics may find that it is a suitable vehicle for keeping up an independent interest in the subject
