Maximizing Energy Efficiency in Heating and Cooling Randy F. Petit, Sr., Turner L. Collins, Earl Delatte, Erik Rasmussen, 2014-07-01 Heating Ventilation Air Conditioning HVAC equipment is only as good as the installation Studies show that the majority of HVACR equipment is not installed to manufacturer specifications costing the consumer more money 68% of all air conditioning systems are improperly charged 70% of all systems have improper airflow 91% of systems remain untested for combustion safety and efficiency The System Performance training manual is broken into four sections Each section covers the techniques and procedures required for a technician to maximize the energy efficiency of HVAC systems 1 Airflow Covers the properties of air airflow measuring tools CFM calculations requirements blower performance and sensible heat ratios 2 Critical Charging Reviews the three charging methods by weight system superheat and condenser subcooling It gives examples of calculating the total charge based on line sizes and provides an easy method to check whether a system is operating to rated capacity 3 Psychrometrics Covers the parts of a psychrometric chart and calculating the thermodynamic properties of air Also this section demonstrates using wet and dry bulb temperatures to plot air conditions being heated or cooled which enables the technician to obtain a systems effect on sensible and latent building load 4 Combustion Analysis This section reviews the basic combustion process and the factors that affect heating efficiency Proper methods for furnace setting of airflow adjustment and testing fuel pressure and flue gas venting

Energy Efficiency in Buildings José Manuel

Andújar, Sergio Gómez Melgar, 2020-04-28 Buildings are one of the main causes of the emission of greenhouse gases in the world Europe alone is responsible for more than 30% of emissions or about 900 million tons of CO₂ per year Heating and air conditioning are the main cause of greenhouse gas emissions in buildings Most buildings currently in use were built with poor energy efficiency criteria or depending on the country and the date of construction none at all Therefore regardless of whether construction regulations are becoming stricter the real challenge nowadays is the energy rehabilitation of existing buildings It is currently a priority to reduce or ideally eliminate the waste of energy in buildings and at the same time supply the necessary energy through renewable sources The first can be achieved by improving the architectural design construction methods and materials used as well as the efficiency of the facilities and systems the second can be achieved through the integration of renewable energy wind solar geothermal etc in buildings In any case regardless of whether the energy used is renewable or not the efficiency must always be taken into account The most profitable and clean energy is that which is not consumed
