introduces machine dynamics an essential competency important for many applications such as designing robots for manufacturing materials handling or the landing gear of an airplane analyzing the motion of a piston in an internal combustion engine or a compressor and designing a Mars Rover Wherever a machine is used for force or power transmission or a mechanism creates a desired motion the methods studied in this book provide the fundamental knowledge needed for optimal design Specific sections are provided on different types of mechanisms and conditions that should be met for obtaining a desired performance including kinematic analysis of mechanisms using direct differentiation relative motion kinematic coefficients and instantaneous centers The Newton Raphson method for solving complex nonlinear position analysis problems is discussed and the determination of dead and limit positions in mechanisms is presented The relation between the angular velocity ratio theorem and the fundamental law of gearing is shown to provide a bridge between the

concept of instantaneous centers and analyzing gears Gears and gear trains are covered in detail and calculation of gear ratios in fixed axis and planetary gear trains using the rolling contact equations is illustrated Finally power and force transmission in machines is covered Static and dynamic cases are analyzed and the author shows how the static solutions can provide approximations for the dynamic problems where inertia effects are not significant low inertia and low accelerations Application of matrix algebra for solving the system of equations of equilibrium in statics or equations of motion in dynamics is also illustrated Because of the importance of balancing in any application involving rotating machinery static and dynamic balancing are analyzed The book concludes with a brief coverage of three dimensional dynamics including Euler's equations and gyroscopic effect Aimed at engineering students interested in machine dynamics across a range of disciplines the book is also ideal as a reference for practicing engineers with a good understanding of statics dynamics and matrix algebra

Contact Dynamics Nikolay Goloshchapov, 2019-02-08 This volume describes the application of the method of the differential specific forces MDSF By using this new method the solutions to the problems of a dissipative viscoelastic and elastic plastic contacts between curvilinear surfaces of two solid bodies can be found The novelty is that the forces of viscosity and the forces of elasticity can be found by an integration of the differential specific forces acting inside an elementary volume of the contact zone This volume shows that this method allows finding the viscoelastic forces for any theoretical or experimental dependencies between the distance of mutual approach of two curvilinear surfaces and the radii of the contact area Also the derivation of the integral equations of the viscoelastic forces has been given and the equations for the contact pressure have been obtained The viscoelastic and elastic plastic contacts at impact between two spherical bodies have been examined The equations for work and energy in the phases of compression and restitution and at the rolling shear have been obtained Approximate solutions for the differential equations of movement displacement by using the method of equivalent work have been calculated This new method of differential specific viscoelastic forces allows us to find the equations for all viscoelastic forces It is principally different from other methods that use Hertz's theory the classical theory of elasticity and the tensor algebra This method will be useful in research of contact dynamics of any shape of contacting surfaces It also can be used for determination of the dynamic mechanical properties of materials and in the design of wear resistant elements and coverings for components of machines and equipment that are in harsh conditions where they are subjected to the action of flow or jet abrasive particles This volume will be useful for professional designers of machines and mechanisms as well as for the design and development of new advanced materials such as wear resistant elastic coatings and elements for pneumatic and hydraulic systems stop valves fans centrifugal pumps injectors valves gate valves and in other installations

MATLAB® With Applications in Mechanics and Tribology Burstein, Leonid, 2021-02-12 Among the wide range of programming tools available the technical analysis and calculations are realized by MATLAB which is recognized as a convenient and effective tool for modern science and technology Thus mastering its latest versions and

practical solutions is increasingly essential for the creation of new products in mechanics electronics chemistry life sciences and modern industry Modern mechanical and tribology sciences specialists widely use computers and some special programs but need a universal tool for solving simulating and modeling specific problems from their area There is plenty of information available on MATLAB for the general engineer but there is a gap in the field for research that applies MATLAB to two wide interdisciplinary and topical areas tribology and mechanics MATLAB With Applications in Mechanics and Tribology explores how MATLAB is used as a tool for subsequent computer solutions applying it to both traditional and modern problems of mechanics and materials sciences The problem solving in this book includes calculations of the mechanical parts machine elements production process quality assurance fluid mechanics parameters thermodynamic and rheological properties of the materials as well as the state equations descriptive statistics and more This book is ideal for scientists students and professors of engineering courses self instructing readers programmers computer scientists practitioners and researchers looking for concise and clear information on learning and applying MATLAB software to mechanics tribology and material physics
