**Antennas** Boris Levin, 2024-12-26 This book describes both known and new results. In the sections devoted to the use of integral equations for the current in a linear metal radiator the focus is on Leontovich's equation. An advantage of this equation is the simplicity of the solution and the absence of the argument in it because the integration is over already performed. The refined solution makes it possible to determine the total sum of the series for the current which is close to the known solution including only the first terms. The results of the synthesis of different types of antennas with capacitive loads are presented which makes it possible to implement Hallen's hypothesis about the usefulness of applying such loads to create an in-phase current distribution in antennas and to obtain required characteristics. New results include the widespread use of the complex potential method in relation to the calculation of capacitive structures in homogeneous and inhomogeneous media, antenna patterns and flows of electrical fields between antenna elements and in the surrounding space. In particular the analysis of field flows makes it possible to substantiate a rigorous method for analyzing microstrip antennas. The characteristics of antennas in various conditions of their installation are considered and compared. The results of the use of multi-floor structures that provide in the wide frequency range the radiation in direction perpendicular to the antenna axis and structures that make it possible to reduce the mutual influence of antennas located at different heights on a common mast are described.

*ASTM Standards for Corrosion Testing of Metals* American Society for Testing and Materials,1990 **The Theory of Thin Antennas and Its Use in Antenna Engineering** Boris Levin,2013-09-17 This book deals with the methods of theoretical and experimental research of antennas which are based on the electromagnetic EM theory The theory of thin antennas explains antenna analysis as thin antennas represent one of the main types of radiators and are extensively applied as both independent antennas and as elements of more complicated antennas The contents of the book cover new methods of antenna analysis and design including the theory of electrically coupled lines the methods of complex potential compensation impedance line and mathematical programming among others New results from these experiments are also detailed The complex potential method is generalized to inhomogeneous media and is employed in conical and parabolic problems The theory of electrically coupled lines allows considering theoretical problems of multi conductor cables and multi radiator antennas The compensation method permits creating a weak field area in the near region of a transmitting antenna The method of impedance line is applied to antennas with loads and the method of mathematical programming deals with selecting loads to develop antennas with the required characteristics The methods described within this text enable engineers to calculate parameters for new types of antennas particularly the self complementary antennas In the general case similar properties pertain to the three dimensional self complementary antennas their variants are also considered in the book Close attention is also paid to the field compensation in the near region of a transmitting antenna and to the creation of the dark spot The book is an essential reference for graduates and researchers requiring knowledge on the design and engineering of new antennas as well as the underlying electromagnetic and mathematical principles
