Recent Advances in Application of Synthetic Biology for Production of Bioactive Compounds, volume II Luan Luong Chu, Jae Kyung Sohng, Dipesh Dhakal, Hanhong Bae, 2025-09-10. Bioactive compounds such as polyphenols, flavonoids, terpenoids, alkaloids, carotenoids, stilbenes and anthocyanins have a great effect on promoting better human welfare as chemical and food additives, agrochemical products, cosmetics, pharmaceuticals and biofuels. Noticeably, these bioactive compounds contain glycosides, steroids, plant sterols and peptides. The exploration, biosynthesis and amplification of potential biological activities of natural and non-natural molecules have remained unchanged as one of the most exciting trends in biotechnological products. Most bioactive compounds are usually isolated from plants, microorganisms, marine organisms and fungi. However, the yield of natural products is usually low and requires time-consuming procedures for industrial production. Furthermore, chemical synthesis is a costly, harmful alternative that requires multi-step isolation and purification processes. Nevertheless, plant molecular engineering has significantly improved using industrially preferred microorganisms such as *Escherichia coli*, *Saccharomyces cerevisiae*, *Corynebacterium*, *Bacillus* and *Pseudomonas*. These microorganisms are promising alternatives for the biosynthesis of industrial products. In recent years, a wide variety of novel technologies for engineering plants and microbes has been developed to produce natural and non-natural compounds from renewable biomasses. Along with evolutionary engineering, metabolic engineering and systems biology, synthetic biology is expected to further improve the productivity of the synthesis of compounds.
