

TYPES OF ESTIMATION TECHNIQUES IN SOFTWARE TESTING

Program Evaluation and Review Technique (PERT)

PERT is an "activity-on-arrow" network diagram first used in the late 1950s by the U.S. Navy. It's a popular method for determining the time required to complete a project.

Use Case Points (UCP)

This technique measures the size of a project based on the software's use cases and their complexity. It's also useful for determining the cost of developing and maintaining the system.

Work Breakdown Structure (WBS)

It works by dividing the work into smaller modules for a more accurate estimation. These modules are further divided into measurable sub-modules. They are then split up into functionalities, and so forth. As a result, you get a detailed hierarchical map of the actual effort.

Delphi Technique

The Delphi technique is a widely used project management technique. In this method, experts will come together to collaborate. They will gather insights to identify the project's potential outcome.

Experience-Based

This technique draws from the experience of the quality assurance team. This approach uses existing documents and estimates as a basis for better results.

Function Points (FP)

Using the FP technique, you can calculate the size of any project and forecast its duration. Plus, it determines the adjusted function point that equals the project size.

Percentage Distribution

All you need to do with this technique is have a team with the expertise to estimate a testing project. You can distribute the entire scope of testing tasks across 100% of the total testing time.

Agile Estimation

An agile estimation method predicts the amount of time it will take to complete a project. The goal is to reduce complexity, improve sprint planning, and foster accountability.

SOFTWARE TESTING SANDEEP DESAI, ABHISHEK SRIVASTAVA, 2012-01-19 This concise text provides an insight into practical aspects of software testing and discusses all the recent technological developments in this field including quality assurance. The book also illustrates the specific kinds of problems that software developers often encounter during development of software. The book first builds up the basic concepts inherent in the software development life cycle SDLC. It then elaborately discusses the methodologies of both static testing and dynamic testing of the software covering the concepts of structured group examinations, control flow and data flow unit testing, integration testing, system testing and acceptance testing. The text also focuses on the importance of the cost-benefit analysis of testing processes. The concepts of test automation, object-oriented applications, client-server and web-based applications have been covered in detail. Finally, the book brings out the underlying concepts of commercial off-the-shelf COTS software applications and describes the testing methodologies adopted in them. The book is intended for the undergraduate and postgraduate students of computer science and engineering for a course in software testing.

KEY FEATURES Provides real-life examples, illustrative diagrams and tables to explain the concepts discussed. Gives a number of assignments drawn from practical experience to help the students in assimilating the concepts in a practical way. Includes model questions in addition to a large number of chapter-end review questions to enable the students to hone their skills and enhance their understanding of the subject matter.

Monitoring, Reporting, and Verification Manual for Clean Development Mechanism Projects Asian Development Bank, 2016-06-01

The Clean Development Mechanism (CDM) a market mechanism under the Kyoto Protocol has been successful in supporting mitigation actions through carbon finance. With nearly 7,700 projects and 290 Program of Activities registered by the CDM Executive Board, the CDM allows GHG emission reduction projects in developing countries to generate Certified Emission Reductions which can be used to offset mandatory or voluntary emission reduction targets. It however requires a robust monitoring, reporting and verification (MRV) to ensure social and environmental integrity of such projects and the emissions reductions thereof. This MRV manual is intended to assist CDM project developers in understanding and managing the MRV requirements and process of their CDM projects in a simple step-by-step manner with the help of real examples and practical tips. While this MRV manual has been developed primarily to assist CDM project developers, it also aspires to be of help for projects participating in other existing and emerging market mechanisms. These may include bilateral mechanisms, voluntary carbon markets, regional, national and subnational carbon markets and any of the cooperative approaches and new market mechanism for the post-2020 carbon markets consequent to the Paris Agreement adopted at COP21 in December 2015. As carbon markets in the region evolve beyond CDM, there is a strong need to maintain and further build institutional capacities to ensure growth and enhanced effectiveness of carbon markets and this MRV manual is
